17 **NOTE CONCERNING WORDING USED IN THIS DOCUMENT**

18 The force of the following words is modified by the requirement level of the document in which
19 they are used.

- 20 • SHALL: This word, or the terms "REQUIRED" or "MUST", means that the definition is an
21 absolute requirement of the specification.
- 22 • SHALL NOT: This phrase, or the phrase "MUST NOT", means that the definition is an
23 absolute prohibition of the specification.
- 24 • SHOULD: This word, or the adjective "RECOMMENDED", means that there may exist valid
25 reasons in particular circumstances to ignore a particular item, but the full implications must
26 be understood and carefully weighed before choosing a different course.
- 27 • SHOULD NOT: This phrase, or the phrase "NOT RECOMMENDED", means that there may
28 exist valid reasons in particular circumstances when the particular behaviour is acceptable
29 or even useful, but the full implications should be understood and the case carefully weighed
30 before implementing any behaviour described with this label.
- 31 • MAY: This word, or the adjective "OPTIONAL", means that an item is truly optional.

84 1 Introduction

85 The assessed element profile is a profile to exchange a list of assessed elements.

86 An assessed element is a network element for which the electrical state is evaluated in a
87 regional or cross-regional process and which value is expected to fulfil regional rules function
88 of the operational security limits.¹

89 The assessed elements are input data describing the elements that shall be assessed during
90 the security analysis.

91 These are the elements on which limit violations are potentially detected (scanned assessed
92 elements) and resolved (secured assessed elements) by applying defined and agreed remedial
93 actions. Assessed elements can be a conducting equipment e.g. a line, transformer, breaker,
94 etc or just a terminal i.e. the end of the equipment. In cases where an assessed element is
95 associated with a conducting equipment the whole equipment is scanned meaning limits defined
96 at all sides of the equipment are scanned. In cases where an assessed element is associated
97 with a terminal only the limits defined for this terminal are scanned. In addition, it shall be noted
98 that only elements from an IGM that are designated as assessed elements are scanned. This
99 means that the party performing the analysis will normally not report, optimise or resolve any
100 limit violations for elements that are not designated as assessed elements. This is designed in
101 this way in order to provide more flexibility to the remedial action optimisation engines
102 eventually helping to minimise computational effort and increase performance.

103 2 Application profile specification

104 2.1 Version information

105 The content is generated from UML model file CGMES30v25_501-20v01_HeaderMetaData-
106 10v08_CSA01v35.eap.

107 This edition is based on the IEC 61970 UML version 'IEC61970CIM17v40', dated '2020-08-24'.

- 108 - Title: Assessed Element Vocabulary
- 109 - Keyword: AE
- 110 - Description: This vocabulary is describing the assessed element profile.
- 111 - Version IRI: <http://entsoe.eu/ns/CIM/AssessedElement-EU/1.0>
- 112 - Version info: 1.0.0
- 113 - Prior version:

119

120 2.2 Constraints naming convention

121 The naming of the rules shall not be used for machine processing. The rule names are just a
122 string. The naming convention of the constraints is as follows.

123 "{rule.Type}:{rule.Standard}:{rule.Profile}:{rule.Property}:{rule.Name}"

¹ [SOURCE: 2019 Inter-RSC report, BRS CAS consistency function, 4.1]

124 where

125 rule.Type: C – for constraint; R – for requirement

126 rule.Standard: the number of the standard e.g. 301 for 61970-301, 456 for 61970-456, 13 for
127 61968-13. 61970-600 specific constraints refer to 600 although they are related to one or
128 combination of the 61970-450 series profiles. For CSA profiles, CSA is used.

129 rule.Profile: the abbreviation of the profile, e.g. TP for Topology profile. If set to “ALL” the
130 constraint is applicable to all IEC 61970-600 profiles.

131 rule.Property: for UML classes, the name of the class, for attributes and associations, the name
132 of the class and attribute or association end, e.g. EnergyConsumer, IdentifiedObject.name, etc.
133 If set to “NA” the property is not applicable to a specific UML element.

134 rule.Name: the name of the rule. It is unique for the same property.

135 Example: C:600:ALL:IdentifiedObject.name:stringLength

136

137

138 2.3 Profile constraints

139 This clause defines requirements and constraints that shall be fulfilled by applications that
140 conform to this document.

141 This document is the master for rules and constraints tagged "CSA". For the sake of self-
142 containment, the list below also includes a copy of the relevant rules from IEC 61970-452,
143 tagged "452".

- 144 • C:452:ALL:NA:datatypes

145 According to 61970-501, datatypes are not exchanged in the instance data. The
146 UnitMultiplier is 1 in cases none value is specified in the profile.

- 147 • R:452:ALL:NA:exchange

148 Optional and required attributes and associations must be imported and exported if they
149 are in the model file prior to import.

- 150 • R:452:ALL:NA:exchange1

151 If an optional attribute does not exist in the imported file, it does not have to be exported
152 in case exactly the same data set is exported, i.e. the tool is not obliged to automatically
153 provide this attribute. If the export is resulting from an action by the user performed after
154 the import, e.g. data processing or model update the export can contain optional
155 attributes.

- 156 • R:452:ALL:NA:exchange2

157 In most of the profiles the selection of optional and required attributes is made so as to
158 ensure a minimum set of required attributes without which the exchange does not fulfil
159 its basic purpose. Business processes governing different exchanges can require
160 mandatory exchange of certain optional attributes or associations. Optional and required
161 attributes and associations shall therefore be supported by applications which claim
162 conformance with certain functionalities of the IEC 61970-452. This provides flexibility
163 for the business processes to adapt to different business requirements and base the
164 exchanges on IEC 61970-452 compliant applications.

- 165 • R:452:ALL:NA:exchange3
- 166 An exporter may, at his or her discretion, produce a serialization containing additional
167 class data described by the CIM Schema but not required by this document provided
168 these data adhere to the conventions established in Clause 5.
- 169 • R:452:ALL:NA:exchange4
- 170 From the standpoint of the model import used by a data recipient, the document
171 describes a subset of the CIM that importing software shall be able to interpret in order
172 to import exported models. Data providers are free to exceed the minimum requirements
173 described herein as long as their resulting data files are compliant with the CIM Schema
174 and the conventions established in Clause 5. The document, therefore, describes
175 additional classes and class data that, although not required, exporters will, in all
176 likelihood, choose to include in their data files. The additional classes and data are
177 labelled as required (cardinality 1..1) or as optional (cardinality 0..1) to distinguish them
178 from their required counterparts. Please note, however, that data importers could
179 potentially receive data containing instances of any and all classes described by the
180 CIM Schema.
- 181 • R:452:ALL:NA:cardinality
- 182 The cardinality defined in the CIM model shall be followed, unless a more restrictive
183 cardinality is explicitly defined in this document. For instance, the cardinality on the
184 association between VoltageLevel and BaseVoltage indicates that a VoltageLevel shall
185 be associated with one and only one BaseVoltage, but a BaseVoltage can be associated
186 with zero to many VoltageLevels.
- 187 • R:452:ALL:NA:associations
- 188 Associations between classes referenced in this document and classes not referenced
189 here are not required regardless of cardinality.
- 190 • R:452:ALL:IdentifiedObject.name:rule
- 191 The attribute “name” inherited by many classes from the abstract class IdentifiedObject
192 is not required to be unique. It must be a human readable identifier without additional
193 embedded information that would need to be parsed. The attribute is used for purposes
194 such as User Interface and data exchange debugging. The MRID defined in the data
195 exchange format is the only unique and persistent identifier used for this data exchange.
196 The attribute IdentifiedObject.name is, however, always required for CoreEquipment
197 profile and Short Circuit profile.
- 198 • R:452:ALL:IdentifiedObject.description:rule
- 199 The attribute “description” inherited by many classes from the abstract class
200 IdentifiedObject must contain human readable text without additional embedded
201 information that would need to be parsed.
- 202 • R:452:ALL:NA:uniqueIdentifier
- 203 All IdentifiedObject-s shall have a persistent and globally unique identifier (Master
204 Resource Identifier - mRID).
- 205 • R:452:ALL:NA:unitMultiplier
- 206 For exchange of attributes defined using CIM Data Types (ActivePower, Susceptance,
207 etc.) a unit multiplier of 1 is used if the UnitMultiplier specified in this document is “none”.

- 208 • C:452:ALL:IdentifiedObject.name:stringLength
- 209 The string IdentifiedObject.name has a maximum of 128 characters.
- 210 • C:452:ALL:IdentifiedObject.description:stringLength
- 211 The string IdentifiedObject.description is maximum 256 characters.
- 212 • C:452:ALL:NA:float
- 213 An attribute that is defined as float (e.g. has a type Float or a type which is a Datatype
- 214 with .value attribute of type Float) shall support ISO/IEC 60559:2020 for floating-point
- 215 arithmetic using single precision floating point. A single precision float supports 7
- 216 significant digits where the significant digits are described as an integer, or a decimal
- 217 number with 6 decimal digits. Two float values are equal when the significant with 7
- 218 digits are identical, e.g. 1234567 is equal 1.234567E6 and so are 1.2345678 and
- 219 1.234567E0.
- 220 • R:CSA:ALL:Region:reference
- 221 The reference to the Region is normally a reference to the capacity calculation region,
- 222 which is identified by “Y” EIC code of the capacity calculation region.
- 223 • R:CSA:ALL:SystemOperator:reference
- 224 The reference to the System Operator is normally identified by “X” EIC code of TSO.
- 225 • R:CSA:AE:AssessedElement:usage
- 226 All elements that need to be scanned for a base case or contingencies shall be explicitly
- 227 defined. If not specified otherwise in another document, an application that performs
- 228 contingency analysis will only report violations that occur on an assessed element and
- 229 will not report any other violations on elements that have operational limits defined, but
- 230 the object in the equipment is not designated as an AssessedElement. Therefore, the
- 231 choice which equipment is scanned shall be made considering multiple factors among
- 232 which the probability of missing potential violations and the performance of the
- 233 contingency analysis.
- 234 • C:CSA:AE:AssessedElement:associations
- 235 An AssessedElement shall be associated with either
- 236 AssessedElement.ConductingEquipment or AssessedElement.AssessedTerminal.

237 2.4 Metadata

238 ENTSO-E agreed to extend the header and metadata definitions by IEC 61970-552 Ed2. This

239 new header definitions rely on W3C recommendations which are used worldwide and are

240 positively recognised by the European Commission. The new definitions of the header mainly

241 use Provenance ontology (PROV-O), Time Ontology and Data Catalog Vocabulary (DCAT). The

242 global new header is included in the metadata and document header specification document.

243 For this profile, header definitions are embedded directly in the profile. The header and the

244 payload are in principle two different profiles, but they are currently implemented as one profile

245 specification due to limitation in the current standards. With the approval of IEC 61970-501 Ed2

246 it will be possible to export it as two embedded profiles.

247 2.4.1 Constraints

248 The identification of the constraints related to the metadata follows the same convention for

249 naming of the constraints as for profile constraints.

- R:CSA:ALL:wasAttributedTo:usage

The prov:wasAttributedTo should normally be the “X” EIC code of the actor (prov:Agent).

252

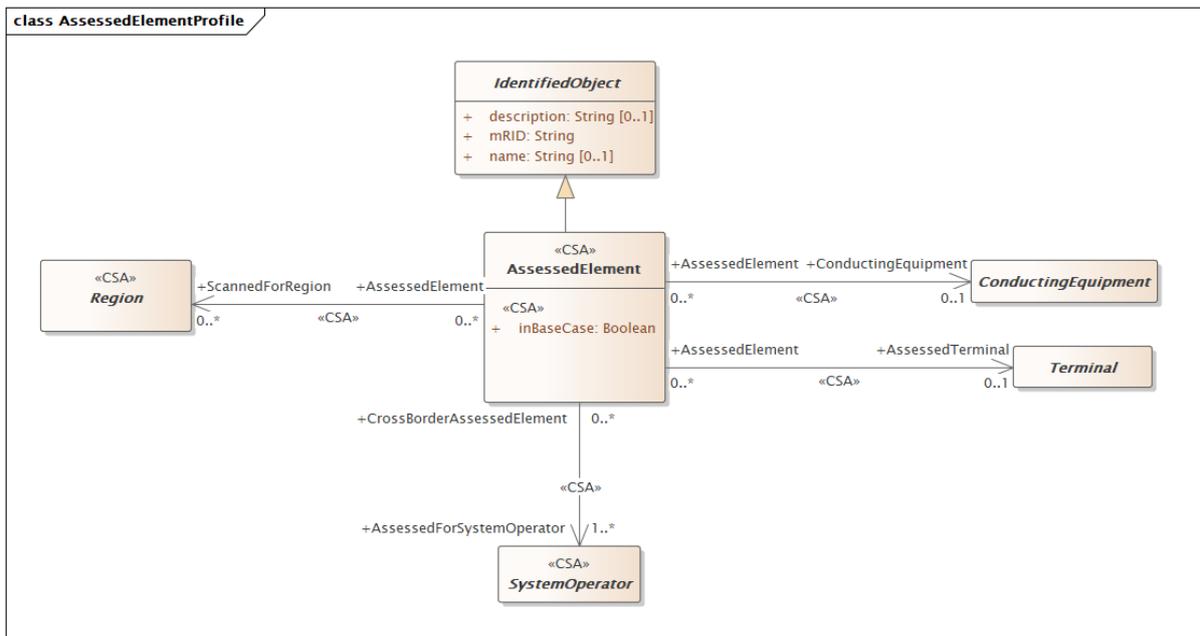

2.4.2 Reference metadata

The header defined for this profile requires availability of a set of reference metadata. For instance, the attribute prov:wasGeneratedBy requires a reference to an activity which produced the model or the related process. The activities are defined as reference metadata and their identifiers are referenced from the header to enable the receiving entity to retrieve the “static” (reference) information that it is not modified frequently. This approach imposes a requirement that both the sending entity and the receiving entity have access to a unique version of the reference metadata. Therefore, each business process shall define which reference metadata is used and where it is located.

3 Detailed Profile Specification

3.1 General

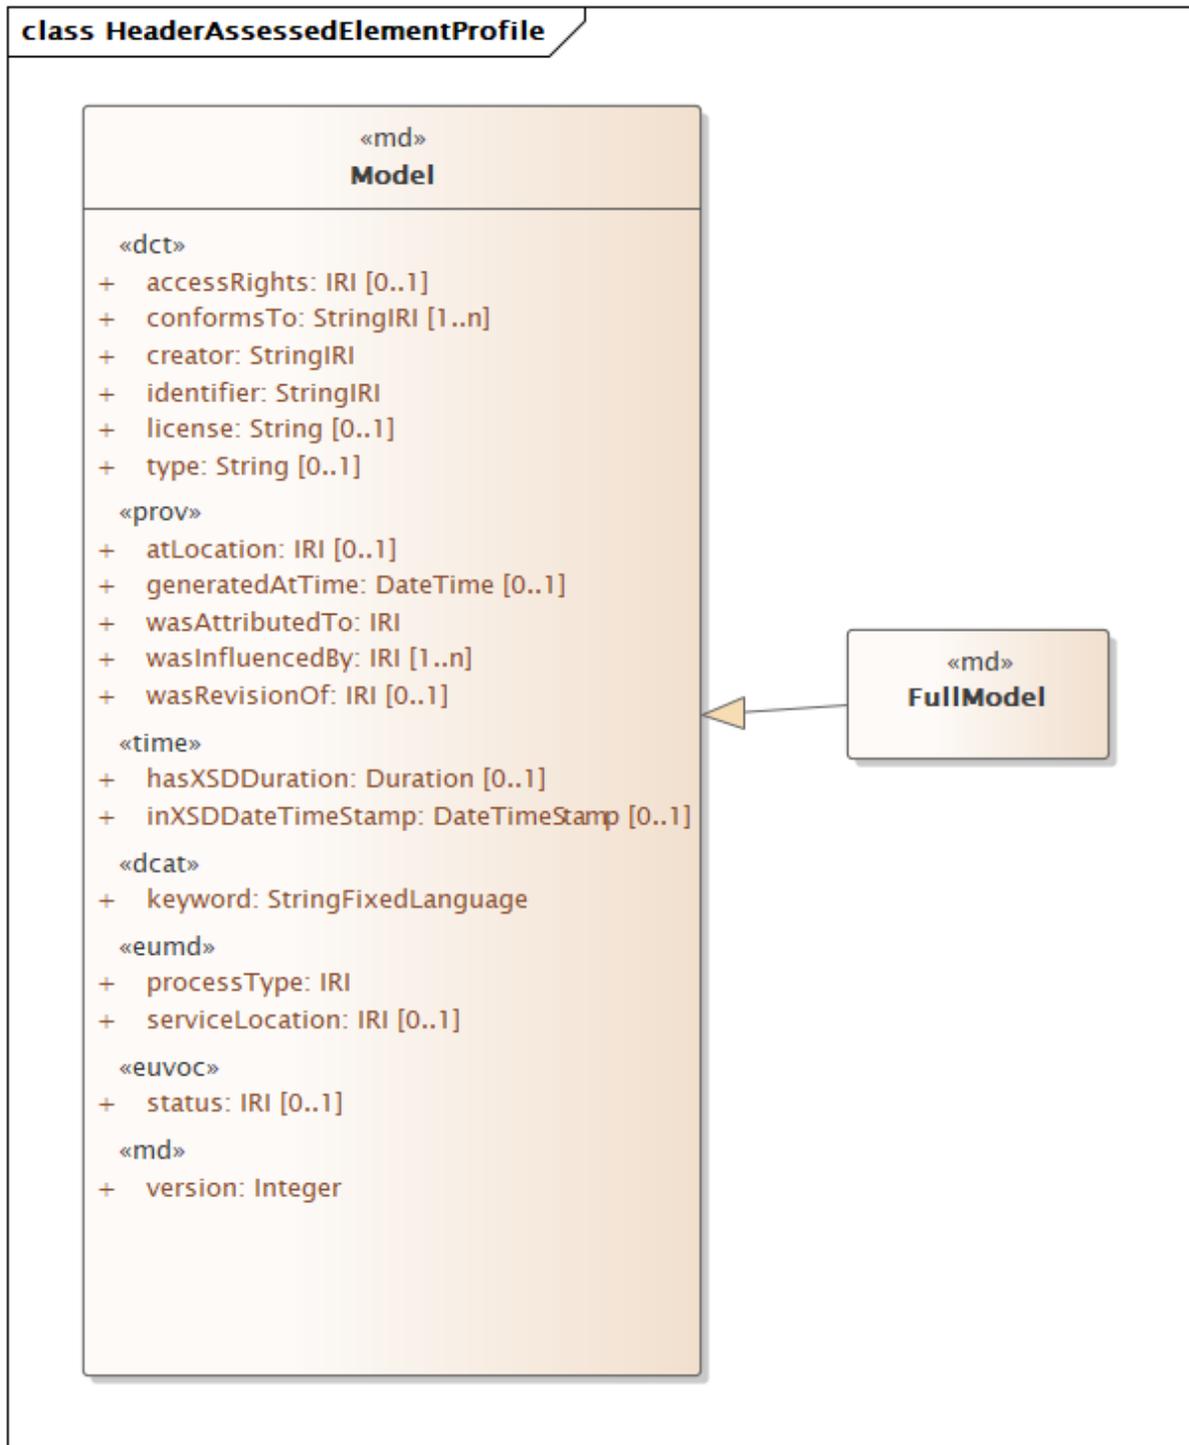

This package contains assessed element profile.

265

266 **Figure 1 – Class diagram AssessedElementProfile::AssessedElementProfile**

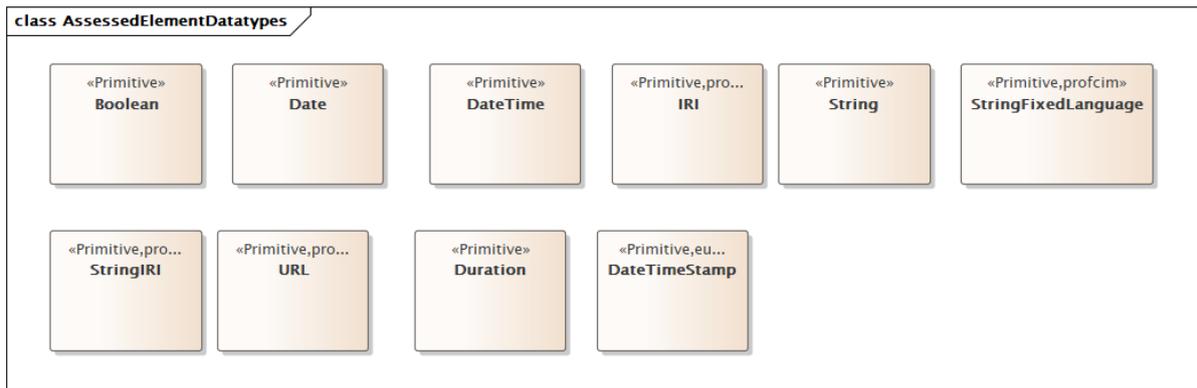

267 Figure 1: The diagram contains the main classes used in the profile.

268

269 **Figure 2 – Class diagram AssessedElementProfile::HeaderAssessedElementProfile**

270 Figure 2: The diagram contains classes related to the header.

271

272 **Figure 3 – Class diagram AssessedElementProfile::AssessedElementDatatypes**

273 Figure 3: The diagram shows datatypes that are used by classes in the profile. Stereotypes are
274 used to describe the datatypes. The following stereotypes are defined:

- 275 <<enumeration>> A list of permissible constant values.
- 276 <<Primitive>> The most basic data types used to compose all other data types.
- 277 <<CIMDatatype>> A datatype that contains a value attribute, an optional unit of measure and
278 a unit multiplier. The unit and multiplier may be specified as a static variable initialized to the
279 allowed value.
- 280 <<Compound>> A composite of Primitive, enumeration, CIMDatatype or other Compound
281 classes, as long as the Compound classes do not recurse.
- 282 For all datatypes both positive and negative values are allowed unless stated otherwise for a
283 particular datatype.

284 **3.2 (abstract) Terminal root class**

285 An AC electrical connection point to a piece of conducting equipment. Terminals are connected
286 at physical connection points called connectivity nodes.

287 **3.3 (md) FullModel**

288 Inheritance path = [Model](#)

289 It represents the full model header and its contents is described by the Model class.

290 Table 1 shows all attributes of FullModel.

291 **Table 1 – Attributes of AssessedElementProfile::FullModel**

292

293 **3.4 (md) Model root class**

294 A Model is a collection of data describing instances, objects or entities, real or computed. In
295 the context of CIM the semantics of the data is defined by profiles. Hence a model can contain
296 equipment data, power flow initial values, power flow results etc.

297 The Model class describes the header content that is the same for the FullModel and the
298 DifferenceModel. A Model is identified by an rdf:about attribute. The rdf:about attribute uniquely
299 describes the model data and not the CIMXML document. A new rdf:about identification is
300 generated for created documents only when the model data has changed. A repeated creation
301 of documents from unchanged model data shall have the same rdf:about identification as
302 previous document generated from the same model data.

303 Table 2 shows all attributes of Model.

304

Table 2 – Attributes of AssessedElementProfile::Model

name	mult	type	description
version	1..1	Integer	(md) The version of the model. If the instance file is imported and exported with no change, the version number is kept the same. The version changes only if the content of the file changes. It is the same logic as for the header id. The version is the human readable id. [CIM context: It relates to the version of the document and not the version of the model which is serialized.]
status	0..1	IRI	(euvoc) Indicates the status of a skos:Concept or a skosxl:Label, or any resource related to controlled vocabulary management. [CIM context: The condition or position of an object with regard to its standing. (Validated, Primary, Backup etc.)].
keyword	1..1	StringFixedLanguage	(dcat) A keyword or tag describing a resource. [CIM context: The intended content type of the model, usually the profile keyword. Used to identify what profiles and content is expected in the document, e.g., Equipment, Boundary, SSH, AE, etc. The same keyword is used for different versions of same profile. It can be also used to identify different content based on the same profile. For instance, as the equipment profile can be used for both boundary data and equipment not related to boundary, the keyword is different to indicate that boundary data is exchanged. In order to avoid ambiguity the property is not exchanged in cases where the document contains multiple profiles referenced by dct:conformsTo.]
accessRights	0..1	IRI	(dct) Information about who access the resource or an indication of its security status.Access

name	mult	type	description
			Rights may include information regarding access or restrictions based on privacy, security, or other policies. [CIM context: Reference to the confidentiality level that shall be applied when handling this model.].
conformsTo	1..n	StringIRI	(dct) An established standard to which the described resource conforms. [CIM context: An IRI describing the profile that governs this model. It uniquely identifies the profile and its version. Multiple instances of the property describe all standards or specifications to which the model and the document representing this model conform to. A document would normally conform to profile definitions, the constraints that relate to the profile and/or the set of business specific constrains. A reference to a machine- readable constrains. A reference to a machine- readable constrains or specification indicates that the document was tested against these constraints and it conforms to them.].
identifier	1..1	StringIRI	(dct) An unambiguous reference to the resource within a given context. Recommended practice is to identify the resource by means of a string conforming to an identification system. Examples include International Standard Book Number (ISBN), Digital Object Identifier (DOI), and Uniform Resource Name (URN). Persistent identifiers should be provided as HTTP URIs. [CIM context: A unique identifier of the model which is serialised in the document where the header is located. The identifier is persistent for a given version of the model and shall change when the model changes. If a model is serialized as complete (full) model or as difference model exchange the identifier shall be the same. The identifier shall not be used as an identifier of the document which can be different for a given version of a model.].
license	0..1	String	(dct) A legal document giving official permission to do something with the resource. Recommended practice is to identify the license document with a URI. If this is not possible or feasible, a literal value that identifies the license may be provided. [CIM context: Reference to the license under which the data is made available. If no license holder is defined, then the original data provider holds the license.].
type	0..1	String	(dct) The nature or genre of the resource. Recommended practice is to use a controlled vocabulary such as the DCMI Type Vocabulary [DCMI-TYPE]. To describe the file format, physical medium, or dimensions of the resource, use the property Format.
generatedAtTime	0..1	DateTime	(prov) Generation is the completion of production of a new entity by an activity. This entity did not exist before generation and becomes available for usage after this generation. [CIM context:

name	mult	type	description
			The date and time when the model was serialized in the document where the header is located. The format is an extended format according to the ISO 8601-2005. European exchanges shall refer to UTC.].
atLocation	0..1	IRI	(prov) A location can be an identifiable geographic place (ISO 19112), but it can also be a non-geographic place such as a directory, row, or column. As such, there are numerous ways in which location can be expressed, such as by a coordinate, address, landmark, and so forth. [CIM context: Reference to a region or a domain for which this model is provided.].
wasInfluencedBy	1..n	IRI	(prov) Influence is the capacity of an entity, activity, or agent to have an effect on the character, development, or behavior of another by means of usage, start, end, generation, invalidation, communication, derivation, attribution, association, or delegation. [CIM context: A reference to the model on which the model serialised in this document depends on. The references are maintained by the producer of the model. Minimum requirements for the dependency are specified and can be restricted within a business process as long as they do not contradict requirements by standards. For instance, IEC 61970-600-1 defines minimum requirements for the profiles defined in that standard.].
wasAttributedTo	1..1	IRI	(prov) Attribution is the ascribing of an entity to an agent. [CIM context: Reference to the agent (or service provider) from which the model originates.].
wasRevisionOf	0..1	IRI	(prov) A revision is a derivation for which the resulting entity is a revised version of some original. The implication here is that the resulting entity contains substantial content from the original. Revision is a particular case of derivation. [CIM context: When a model is updated the resulting model supersedes the models that were used as basis for the update. Hence this is a reference to the model which are superseded by this model. A model can supersede 1 or more models, e.g. a difference model or a full model supersede multiple models (difference or full). In this case, multiple properties are included in the header. The referenced document(s) is (are) identified by the URN/MRID/UUID in the FullModel rdf:about attribute when full model(s) is (are) referenced and by the URN/MRID/UUID in the DifferenceModel rdf:about attribute when difference model(s) is (are) referenced.].
inXSDDateTimeStamp	0..1	DateTimeStamp	(time) Position of an instant, expressed using xsd:dateTimeStamp, in which the time-zone field is mandatory. [CIM context: The date and time that this model represents, i.e. for which the model is (or was) valid. If used

name	mult	type	description
			in relation with hasXSDDuration it indicates the beginning of the validity period. It is indicating either an instant (in cases where the model is only valid for a point in time) or the start time of a period. If not provided the model is considered valid for any time stamp. The format is an extended format according to the ISO 8601-2005. European exchanges shall refer to UTC.]
hasXSDDuration	0..1	Duration	(time) Extent of a temporal entity, expressed using xsd:duration. [CIM context: The duration of the validity period of the model that it is serialized in the document where the header is located. It is only used in relation to the inXSDDateTimeStamp property which indicates the beginning of the validity period of the model. The end of the validity period is derived from both inXSDDateTimeStamp and hasXSDDuration.]
processType	1..1	IRI	(eumd) The exact business nature. Reference to Business Process configurations.
creator	1..1	StringIRI	(dct) An entity responsible for making the resource. Recommended practice is to identify the creator with a URI. If this is not possible or feasible, a literal value that identifies the creator may be provided. [CIM context: The name of the agent (Modeling Authority) from which the model originates].
serviceLocation	0..1	IRI	(eumd) Reference to a service location (region or a domain).

305

306 **3.5 (abstract,CSA) Region root class**

307 A region where the system operator belongs to.

308 **3.6 (CSA) AssessedElement**309 Inheritance path = [IdentifiedObject](#)

310 Assessed element is a network element for which the electrical state is evaluated in the regional or cross-regional process and which value is expected to fulfil regional rules function of the operational security limits.

313 The information of the validity period of the assessed element is derived from the conducting equipment.

315 The measurements and limits are as defined in the steady state hypothesis.

316 Table 3 shows all attributes of AssessedElement.

317

Table 3 – Attributes of AssessedElementProfile::AssessedElement

name	mult	type	description
inBaseCase	1..1	Boolean	(CSA) Indicates if the assessed element is scanned in the base case. True means that the assessed element is scanned in the base case. False means it is not scanned in the base case. In case of false the association AssessedElement.Contingency is required.
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject

name	mult	type	description
name	0..1	String	inherited from: IdentifiedObject

318

319

Table 4 shows all association ends of AssessedElement with other classes.

320

Table 4 – Association ends of AssessedElementProfile::AssessedElement with other classes

321

mult from	name	mult to	type	description
0..*	AssessedTerminal	0..1	Terminal	(CSA) The terminal that is assessed.
0..*	ConductingEquipment	0..1	ConductingEquipment	(CSA) The conducting equipment that is designated as an assessed element, i.e. the equipment that is assessed.
0..*	AssessedForSystemOperator	1..*	SystemOperator	(CSA) All system operators for which this cross border assessed element is assessed.
0..*	ScannedForRegion	0..*	Region	(CSA) This is the region in which this assessed element is scanned.

322

323

3.7 (abstract,CSA) SystemOperator root class

324

System operator.

325

3.8 (abstract) ConductingEquipment root class

326

The parts of the AC power system that are designed to carry current or that are conductively connected through terminals.

327

328

3.9 (abstract) IdentifiedObject root class

329

This is a root class to provide common identification for all classes needing identification and naming attributes.

330

331

Table 5 shows all attributes of IdentifiedObject.

332

Table 5 – Attributes of AssessedElementProfile::IdentifiedObject

name	mult	type	description
description	0..1	String	The description is a free human readable text describing or naming the object. It may be non unique and may not correlate to a naming hierarchy.
mRID	1..1	String	Master resource identifier issued by a model authority. The mRID is unique within an exchange context. Global uniqueness is easily achieved by using a UUID, as specified in RFC 4122, for the mRID. The use of UUID is strongly recommended. For CIMXML data files in RDF syntax conforming to IEC 61970-552, the mRID is mapped to rdf:ID or rdf:about attributes that identify CIM object elements.
name	0..1	String	The name is any free human readable and possibly non unique text naming the object.

333

334

3.10 Boolean primitive

335

A type with the value space "true" and "false".

336 3.11 Date primitive

337 Date as "yyyy-mm-dd", which conforms with ISO 8601. UTC time zone is specified as "yyyy-
338 mm-ddZ". A local timezone relative UTC is specified as "yyyy-mm-dd(+/-)hh:mm".

339 3.12 DateTime primitive

340 Date and time as "yyyy-mm-ddThh:mm:ss.sss", which conforms with ISO 8601. UTC time zone
341 is specified as "yyyy-mm-ddThh:mm:ss.sssZ". A local timezone relative UTC is specified as
342 "yyyy-mm-ddThh:mm:ss.sss-hh:mm". The second component (shown here as "ss.sss") could
343 have any number of digits in its fractional part to allow any kind of precision beyond seconds.

344 3.13 (eumd) DateTimeStamp primitive

345 Position of an instant, expressed using xsd:dateTimeStamp, in which the time-zone field is
346 mandatory.

347 3.14 Duration primitive

348 Duration as "PnYnMnDTnHnMnS" which conforms to ISO 8601, where nY expresses a number
349 of years, nM a number of months, nD a number of days. The letter T separates the date
350 expression from the time expression and, after it, nH identifies a number of hours, nM a number
351 of minutes and nS a number of seconds. The number of seconds could be expressed as a
352 decimal number, but all other numbers are integers.

353 3.15 (profcim) IRI primitive

354 An IRI (Internationalized Resource Identifier) within an RDF graph is a Unicode string that
355 conforms to the syntax defined in RFC 3987.

356 The primitive is serialized as rdf:resource in RDFXML.

357 IRIs in the RDF abstract syntax must be absolute, and may contain a fragment identifier.

358 IRI equality: Two IRIs are equal if and only if they are equivalent under Simple String
359 Comparison according to section 5.1 of [RFC3987]. Further normalization must not be
360 performed when comparing IRIs for equality.

361 IRIs are a generalization of URIs [RFC3986] that permits a wider range of Unicode characters.
362 Every absolute URI and URL is an IRI, but not every IRI is an URI. When IRIs are used in
363 operations that are only defined for URIs, they must first be converted according to the mapping
364 defined in section 3.1 of [RFC3987]. A notable example is retrieval over the HTTP protocol. The
365 mapping involves UTF-8 encoding of non-ASCII characters, %-encoding of octets not allowed
366 in URIs, and Punycode-encoding of domain names.

367 3.16 String primitive

368 A string consisting of a sequence of characters. The character encoding is UTF-8. The string
369 length is unspecified and unlimited.

370 3.17 (profcim) StringFixedLanguage primitive

371 A string consisting of a sequence of characters. The character encoding is UTF-8. The string
372 length is unspecified and unlimited.

373 The primitive is serialized as literal without language support.

374 3.18 (profcim) StringIRI primitive

375 An IRI (Internationalized Resource Identifier) within an RDF graph is a Unicode string that
376 conforms to the syntax defined in RFC 3987.

377 The primitive is serialized as literal without language support.

378 IRIs in the RDF abstract syntax must be absolute, and may contain a fragment identifier.

379 IRI equality: Two IRIs are equal if and only if they are equivalent under Simple String
380 Comparison according to section 5.1 of [RFC3987]. Further normalization must not be
381 performed when comparing IRIs for equality.

382 IRIs are a generalization of URIs [RFC3986] that permits a wider range of Unicode characters.
383 Every absolute URI and URL is an IRI, but not every IRI is an URI. When IRIs are used in
384 operations that are only defined for URIs, they must first be converted according to the mapping
385 defined in section 3.1 of [RFC3987]. A notable example is retrieval over the HTTP protocol. The

386 mapping involves UTF-8 encoding of non-ASCII characters, %-encoding of octets not allowed
387 in URIs, and Punycode-encoding of domain names.

388 **3.19 (profcim) URL primitive**

389 A Uniform Resource Locator (URL), colloquially termed a web address, is a reference to a web
390 resource that specifies its location on a computer network and a mechanism for retrieving it. A
391 URL is a specific type of Uniform Resource Identifier (URI), although many people use the two
392 terms interchangeably. URLs occur most commonly to reference web pages (http), but are also
393 used for file transfer (ftp), email (mailto), database access (JDBC), and many other applications.

394

395

396 **Annex A (informative): Sample data**397 **A.1 General**

398 This Annex is designed to illustrate the profile by using fragments of sample data. It is not meant
399 to be a complete set of examples covering all possibilities of using the profile. Defining a
400 complete set of test data is considered a separate activity to be performed for the purpose of
401 setting up interoperability testing and conformity related to this profile.
