NOTE CONCERNING WORDING USED IN THIS DOCUMENT

The force of the following words is modified by the requirement level of the document in which they are used.

- SHALL: This word, or the terms “REQUIRED” or “MUST”, means that the definition is an absolute requirement of the specification.
- SHALL NOT: This phrase, or the phrase “MUST NOT”, means that the definition is an absolute prohibition of the specification.
- SHOULD: This word, or the adjective “RECOMMENDED”, means that there may exist valid reasons in particular circumstances to ignore a particular item, but the full implications must be understood and carefully weighed before choosing a different course.
- SHOULD NOT: This phrase, or the phrase “NOT RECOMMENDED”, means that there may exist valid reasons in particular circumstances when the particular behaviour is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behaviour described with this label.
- MAY: This word, or the adjective “OPTIONAL”, means that an item is truly optional.

List of tables

1 Introduction

The impact assessment matrix profile is a profile to exchange impact assessment matrices that are needed within the process.

The impact assessment matrix is an output of the impact assessment done on proposed remedial actions.

Three impact assessment matrices can be exchanged: list-based impact assessment matrix, calculation-based impact assessment matrix and coordination impact assessment matrix. The coordination impact assessment matrix aggregates or considers the information from other two impact assessment matrices. The connecting TSO matrix is not explicitly exchanged as it can be derived from the available remedial action data exchange.

2 Application profile specification

2.1 Version information

The content is generated from UML model file CGMES30v25_501-20v01_HeaderMetaData-10v08_CSA01v35.eap.

This edition is based on the IEC 61970 UML version 'IEC61970CIM17v40', dated '2020-08-24'.

- Title: Impact Assessment Matrix Vocabulary
- Keyword: IAM
- Description: This vocabulary is describing the impact assessment matrix profile.
- Version IRI: http://entsoe.eu/ns/CIM/ImpactAssessmentMatrix-EU/1.0
- Version info: 1.0.0
- Prior version:
- Conforms to: urn:iso:std:iec:61970-600-2:ed-1|urn:iso:std:iec:61970-301:ed-7:amd1|file://iec61970cim17v40_iec61968cim13v13a_iec62325cim03v17a.eap|urn:iso:std:iec:61970-401:draft:ed-1|urn:iso:std:iec:61970-501:draft:ed-2|file://CGMES-30v25_501-20v01.eap
- Identifier: urn:uuid:1eb41c0b-3c58-4762-a79b-33220d051d32

2.2 Constraints naming convention

The naming of the rules shall not be used for machine processing. The rule names are just a string. The naming convention of the constraints is as follows.

"{rule.Type}:{rule.Standard}:{rule.Profile}:{rule.Property}:{rule.Name}"

where

rule.Type: C – for constraint; R – for requirement

rule.Standard: the number of the standard e.g. 301 for 61970-301, 456 for 61970-456, 13 for 61968-13. 61970-600 specific constraints refer to 600 although they are related to one or combination of the 61970-450 series profiles. For CSA profiles, CSA is used.

rule.Profile: the abbreviation of the profile, e.g. TP for Topology profile. If set to "ALL" the constraint is applicable to all IEC 61970-600 profiles.

rule.Property: for UML classes, the name of the class, for attributes and associations, the name of the class and attribute or association end, e.g. EnergyConsumer, IdentifiedObject.name, etc. If set to “NA” the property is not applicable to a specific UML element.

rule.Name: the name of the rule. It is unique for the same property.

Example: C:600:ALL:IdentifiedObject.name:stringLength

2.3 Profile constraints

This clause defines requirements and constraints that shall be fulfilled by applications that conform to this document.

This document is the master for rules and constraints tagged "CSA". For the sake of self-containment, the list below also includes a copy of the relevant rules from IEC 61970-452, tagged "452".

- C:452:ALL:NA:datatypes

  According to 61970-501, datatypes are not exchanged in the instance data. The UnitMultiplier is 1 in cases none value is specified in the profile.

- R:452:ALL:NA:exchange

  Optional and required attributes and associations must be imported and exported if they are in the model file prior to import.

- R:452:ALL:NA:exchange1

  If an optional attribute does not exist in the imported file, it does not have to be exported in case exactly the same data set is exported, i.e. the tool is not obliged to automatically provide this attribute. If the export is resulting from an action by the user performed after the import, e.g. data processing or model update the export can contain optional attributes.

- R:452:ALL:NA:exchange2

  In most of the profiles the selection of optional and required attributes is made so as to ensure a minimum set of required attributes without which the exchange does not fulfil its basic purpose. Business processes governing different exchanges can require mandatory exchange of certain optional attributes or associations. Optional and required attributes and associations shall therefore be supported by applications which claim conformance with certain functionalities of the IEC 61970-452. This provides flexibility for the business processes to adapt to different business requirements and base the exchanges on IEC 61970-452 compliant applications.

- R:452:ALL:NA:exchange3

  An exporter may, at his or her discretion, produce a serialization containing additional class data described by the CIM Schema but not required by this document provided these data adhere to the conventions established in Clause 5.

- R:452:ALL:NA:exchange4

  From the standpoint of the model import used by a data recipient, the document describes a subset of the CIM that importing software shall be able to interpret in order

to import exported models. Data providers are free to exceed the minimum requirements described herein as long as their resulting data files are compliant with the CIM Schema and the conventions established in Clause 5. The document, therefore, describes additional classes and class data that, although not required, exporters will, in all likelihood, choose to include in their data files. The additional classes and data are labelled as required (cardinality 1..1) or as optional (cardinality 0..1) to distinguish them from their required counterparts. Please note, however, that data importers could potentially receive data containing instances of any and all classes described by the CIM Schema.

- R:452:ALL:NA:cardinality

  The cardinality defined in the CIM model shall be followed, unless a more restrictive cardinality is explicitly defined in this document. For instance, the cardinality on the association between VoltageLevel and BaseVoltage indicates that a VoltageLevel shall be associated with one and only one BaseVoltage, but a BaseVoltage can be associated with zero to many VoltageLevels.

- R:452:ALL:NA:associations

  Associations between classes referenced in this document and classes not referenced here are not required regardless of cardinality.

- R:452:ALL:IdentifiedObject.name:rule

  The attribute “name” inherited by many classes from the abstract class IdentifiedObject is not required to be unique. It must be a human readable identifier without additional embedded information that would need to be parsed. The attribute is used for purposes such as User Interface and data exchange debugging. The MRID defined in the data exchange format is the only unique and persistent identifier used for this data exchange. The attribute IdentifiedObject.name is, however, always required for CoreEquipment profile and Short Circuit profile.

- R:452:ALL:IdentifiedObject.description:rule

  The attribute “description” inherited by many classes from the abstract class IdentifiedObject must contain human readable text without additional embedded information that would need to be parsed.

- R:452:ALL:NA:uniqueIdentifier

  All IdentifiedObject-s shall have a persistent and globally unique identifier (Master Resource Identifier - mRID).

- R:452:ALL:NA:unitMultiplier

  For exchange of attributes defined using CIM Data Types (ActivePower, Susceptance, etc.) a unit multiplier of 1 is used if the UnitMultiplier specified in this document is “none”.

- C:452:ALL:IdentifiedObject.name:stringLength

  The string IdentifiedObject.name has a maximum of 128 characters.

- C:452:ALL:IdentifiedObject.description:stringLength

  The string IdentifiedObject.description is maximum 256 characters.

- C:452:ALL:NA:float

An attribute that is defined as float (e.g. has a type Float or a type which is a Datatype with .value attribute of type Float) shall support ISO/IEC 60559:2020 for floating-point arithmetic using single precision floating point. A single precision float supports 7 significant digits where the significant digits are described as an integer, or a decimal number with 6 decimal digits. Two float values are equal when the significant with 7 digits are identical, e.g. 1234567 is equal 1.234567E6 and so are 1.2345678 and 1.234567E0.

- R:CSA:ALL:Region:reference

  The reference to the Region is normally a reference to the capacity calculation region, which is identified by “Y” EIC code of the capacity calculation region.

- R:CSA:ALL:SystemOperator:reference

  The reference to the System Operator is normally identified by “X” EIC code of TSO.

- C:CSA:IAM:OutcomeValue.RemedialAction:listBasedImpactAssessmentMatrix

  For a ListBasedImpactAssessmentMatrix, the multiplicity of the association end OutcomeValue.RemedialAction is restricted to 1. In this case, the association OutcomeValue.RemedialActionSchedule shall not be exchanged.

- C:CSA:IAM:OutcomeValue.RemedialActionSchedule:calculationBasedImpactAssessmentMatrix

  For a CalculationBasedImpactAssessmentMatrix, the multiplicity of the association end OutcomeValue.RemedialActionSchedule is restricted to 1. In this case, the association OutcomeValue.RemedialAction shall not be exchanged.

- C:CSA:IAM:CoordinatedImpactAssessmentMatrix:outcomeValue

  For a CalculationBasedImpactAssessmentMatrix, an OutcomeValue shall be associated with either OutcomeValue.RemedialAction or OutcomeValue.RemedialActionSchedule.

2.4 Metadata

ENTSO-E agreed to extend the header and metadata definitions by IEC 61970-552 Ed2. This new header definitions rely on W3C recommendations which are used worldwide and are positively recognised by the European Commission. The new definitions of the header mainly use Provenance ontology (PROV-O), Time Ontology and Data Catalog Vocabulary (DCAT). The global new header is included in the metadata and document header specification document.

For this profile, header definitions are embedded directly in the profile. The header and the payload are in principle two different profiles, but they are currently implemented as one profile specification due to limitation in the current standards. With the approval of IEC 61970-501 Ed2 it will be possible to export it as two embedded profiles.

2.4.1 Constraints

The identification of the constraints related to the metadata follows the same convention for naming of the constraints as for profile constraints.

- R:CSA:ALL:wasAttributedTo:usage

  The prov:wasAttributedTo should normally be the “X” EIC code of the actor (prov:Agent).

2.4.2 Reference metadata

The header defined for this profile requires availability of a set of reference metadata. For instance, the attribute prov:wasGeneratedBy requires a reference to an activity which produced the model or the related process. The activities are defined as reference metadata and their identifiers are referenced from the header to enable the receiving entity to retrieve the “static” (reference) information that is not modified frequently. This approach imposes a requirement that both the sending entity and the receiving entity have access to a unique version of the reference metadata. Therefore, each business process shall define which reference metadata is used and where it is located.

3 Detailed Profile Specification

3.1 General

This package contains impact assessment matrix profile.

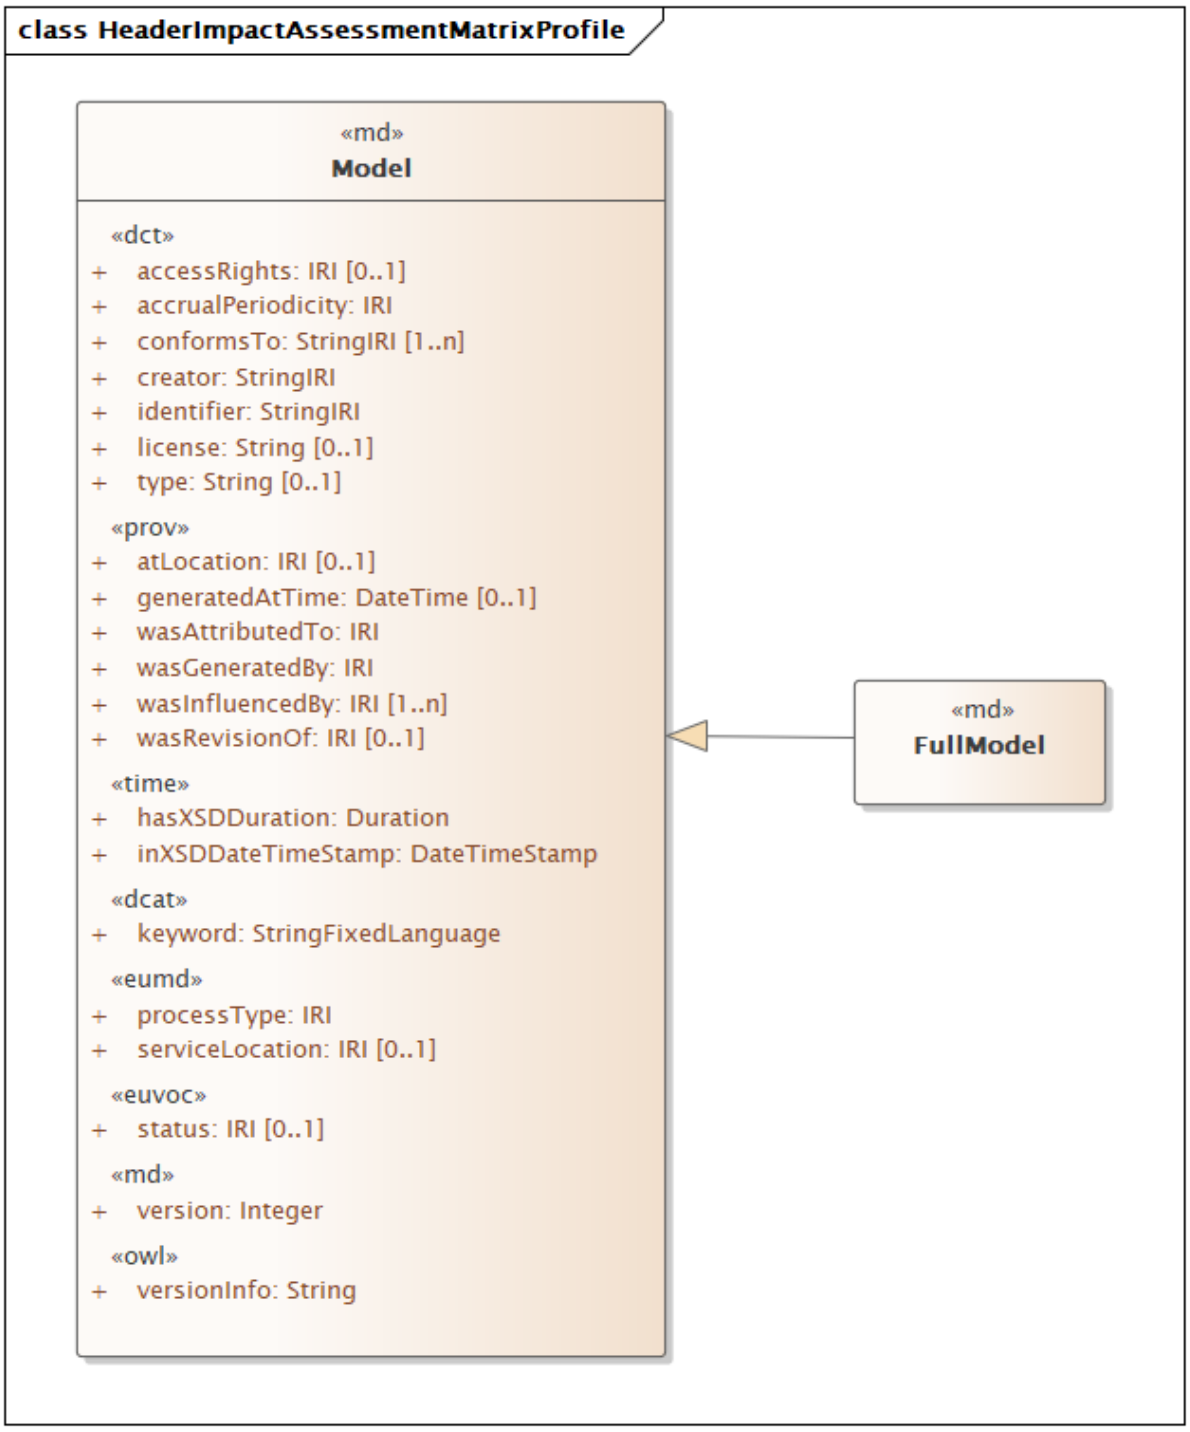

Figure 1 – Class diagram
ImpactAssessmentMatrixProfile::HeaderImpactAssessmentMatrixProfile

Figure 1: The diagram contains classes related to the header.

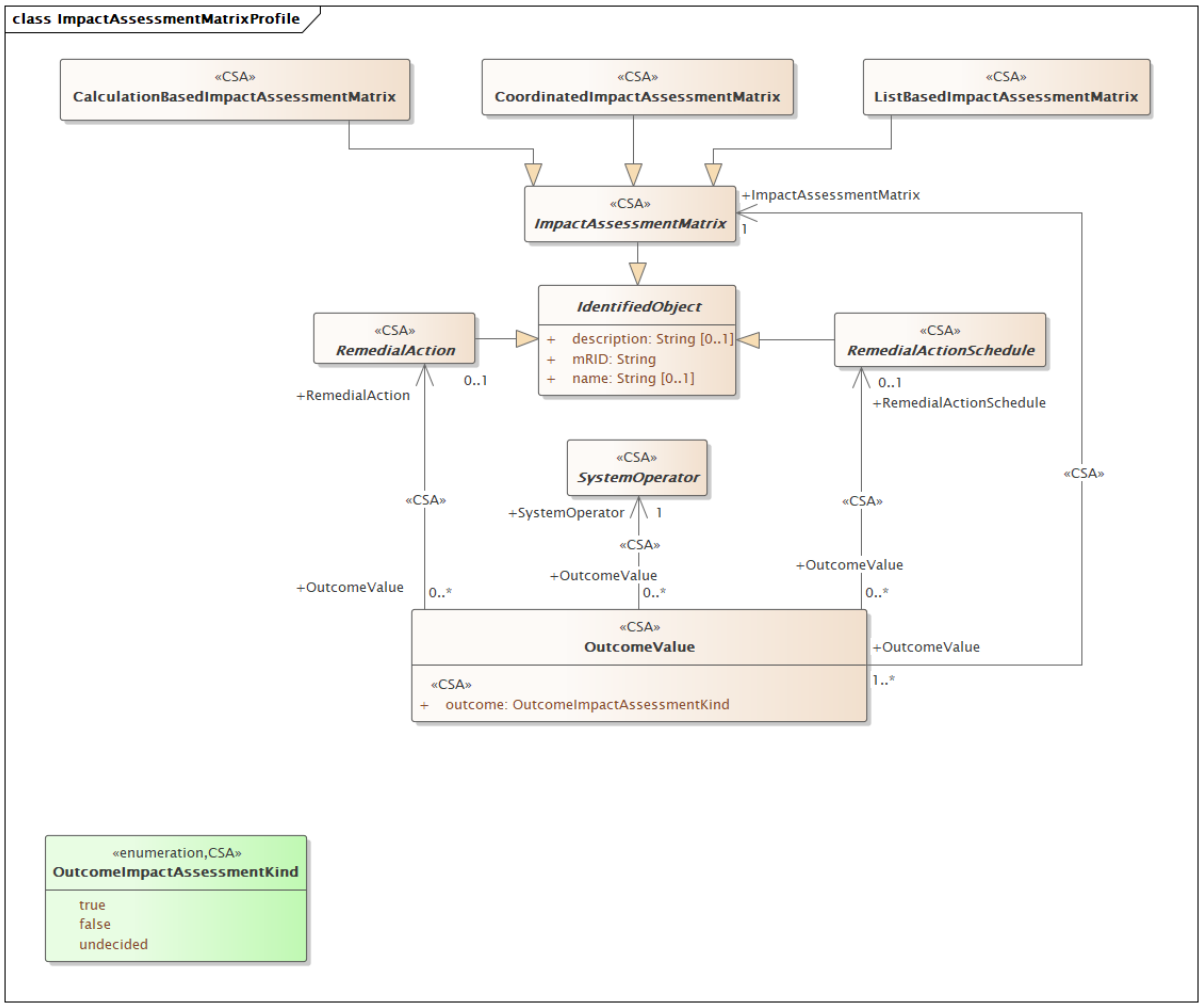

Figure 2 – Class diagram
ImpactAssessmentMatrixProfile::ImpactAssessmentMatrixProfile

Figure 2: The diagram contains the main classes used in the profile.

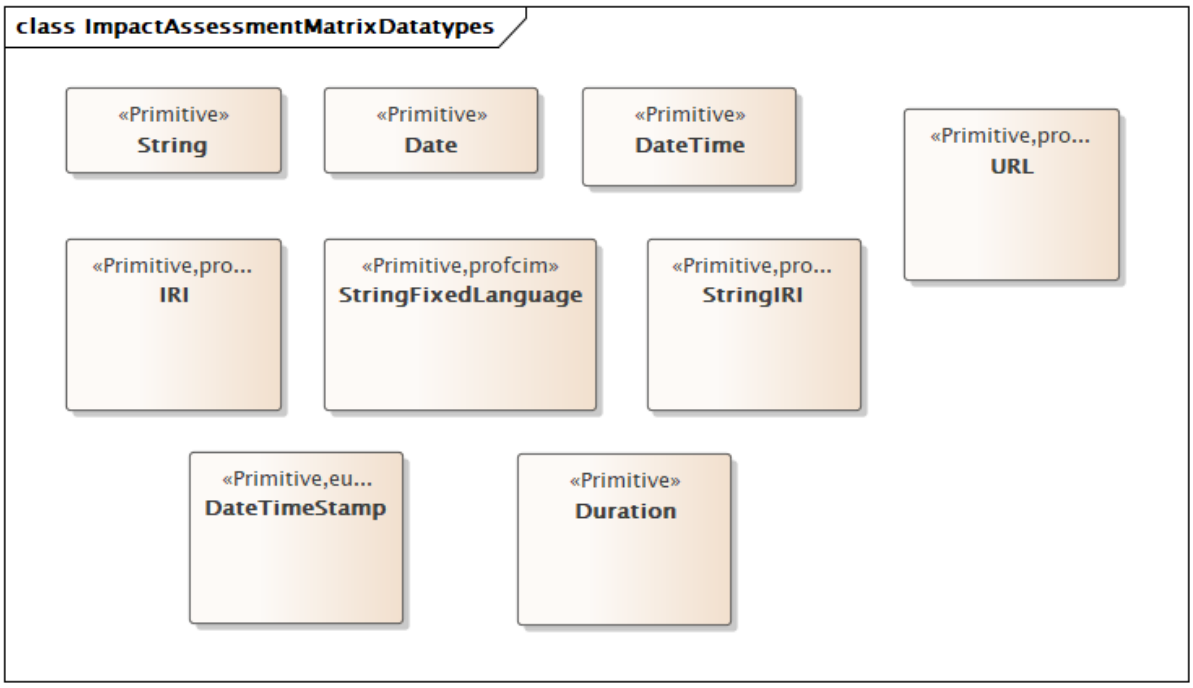

Figure 3 – Class diagram
ImpactAssessmentMatrixProfile::ImpactAssessmentMatrixDatatypes

Figure 3: The diagram shows datatypes that are used by classes in the profile. Stereotypes are used to describe the datatypes. The following stereotypes are defined:
<<enumeration>> A list of permissible constant values.
<<Primitive>> The most basic data types used to compose all other data types.
<<CIMDatatype>> A datatype that contains a value attribute, an optional unit of measure and a unit multiplier. The unit and multiplier may be specified as a static variable initialized to the allowed value.
<<Compound>> A composite of Primitive, enumeration, CIMDatatype or other Compound classes, as long as the Compound classes do not recurse.
For all datatypes both positive and negative values are allowed unless stated otherwise for a particular datatype.

3.2 (md) FullModel

Inheritance path = Model
It represents the full model header and its contents is described by the Model class.
Table 1 shows all attributes of FullModel.

Table 1 – Attributes of ImpactAssessmentMatrixProfile::FullModel

name	mult	type	description
version	1..1	Integer	(md) inherited from: Model
accrualPeriodicity	1..1	IRI	(dct) inherited from: Model
status	0..1	IRI	(euvoc) inherited from: Model

conformsTo	1..n	StringIRI	(dct) inherited from: Model
identifier	1..1	StringIRI	(dct) inherited from: Model
license	0..1	String	(dct) inherited from: Model

name	mult	type	description
type	0..1	String	(dct) inherited from: Model
generatedAtTime	0..1	DateTime	(prov) inherited from: Model
atLocation	0..1	IRI	(prov) inherited from: Model
wasInfluencedBy	1..n	IRI	(prov) inherited from: Model
wasGeneratedBy	1..1	IRI	(prov) inherited from: Model
wasAttributedTo	1..1	IRI	(prov) inherited from: Model
wasRevisionOf	0..1	IRI	(prov) inherited from: Model
inXSDDateTimeStamp	1..1	DateTimeStamp	(time) inherited from: Model
hasXSDDuration	1..1	Duration	(time) inherited from: Model
processType	1..1	IRI	(eumd) inherited from: Model
creator	1..1	StringIRI	(dct) inherited from: Model
serviceLocation	0..1	IRI	(eumd) inherited from: Model

3.3 (md) Model root class

A Model is a collection of data describing instances, objects or entities, real or computed. In the context of CIM the semantics of the data is defined by profiles. Hence a model can contain equipment data, power flow initial values, power flow results etc.
The Model class describes the header content that is the same for the FullModel and the DifferenceModel. A Model is identified by an rdf:about attribute. The rdf:about attribute uniquely describes the model data and not the CIMXML document. A new rdf:about identification is generated for created documents only when the model data has changed. A repeated creation of documents from unchanged model data shall have the same rdf:about identification as previous document generated from the same model data.
Table 2 shows all attributes of Model.

Table 2 – Attributes of ImpactAssessmentMatrixProfile::Model

name	mult	type	description
version	1..1	Integer	(md) The version of the model. If the instance file is imported and exported with no change, the version number is kept the same. The version changes only if the content of the file changes. It is the same logic as for the header id. The version is the human readable id. [CIM context: It relates to the version of the document and not the version of the model which is serialized.].
accrualPeriodicity	1..1	IRI	(dct) The frequency with which items are added to a collection. [CIM context: Reference to the time frame.].
status	0..1	IRI	(euvoc) Indicates the status of a skos:Concept or a skosxl:Label, or any resource related to controlled vocabulary management. [CIM context: The condition or position of an object with regard to its standing. (Validated, Primary, Backup etc.)].
keyword	1..1	StringFixedLanguage	(dcat) A keyword or tag describing a resource. [CIM context: The intended content type of the model, usually the profile keyword. Used to identify what

name	mult	type	description
			profiles and content is expected in the document, e.g., Equipment, Boundary, SSH, AE, etc. The same keyword is used for different versions of same profile. It can be also used to identify different content based on the same profile. For instance, as the equipment profile can be used for both boundary data and equipment not related to boundary, the keyword is different to indicate that boundary data is exchanged. In order to avoid ambiguity the property is not exchanged in cases where the document contains multiple profiles referenced by dct:conformsTo.].
accessRights	0..1	IRI	(dct) Information about who access the resource or an indication of its security status.Access Rights may include information regarding access or restrictions based on privacy, security, or other policies. [CIM context: Reference to the confidentiality level that shall be applied when handling this model.].
conformsTo	1..n	StringIRI	(dct) An established standard to which the described resource conforms. [CIM context: An IRI describing the profile that governs this model. It uniquely identifies the profile and its version. Multiple instances of the property describe all standards or specifications to which the model and the document representing this model conform to. A document would normally conform to profile definitions, the constraints that relate to the profile and/or the set of business specific constrains. A reference to a machine- readable constraints or specification indicates that the document was tested against these constraints and it conforms to them.].
identifier	1..1	StringIRI	(dct) An unambiguous reference to the resource within a given context. Recommended practice is to identify the resource by means of a string conforming to an identification system. Examples include International Standard Book Number (ISBN), Digital Object Identifier (DOI), and Uniform Resource Name (URN). Persistent identifiers should be provided as HTTP URIs. [CIM context: A unique identifier of the model which is serialised in the document where the header is located. The identifier is persistent for a given version of the model and shall change when the model changes. If a model is serialized as complete (full) model or as difference model exchange the identifier shall be the same. The identifier shall not be used as an identifier of the document which can be different for a given version of a model.].
license	0..1	String	(dct) A legal document giving official permission to do something with the resource. Recommended practice is to identify the license document with a URI. If this is not possible or feasible, a literal value that identifies the license may be provided. [CIM context:

name	mult	type	description
			Reference to the license under which the data is made available. If no license holder is defined, then the original data provider holds the license.].
type	0..1	String	(dct) The nature or genre of the resource. Recommended practice is to use a controlled vocabulary such as the DCMI Type Vocabulary [DCMI-TYPE]. To describe the file format, physical medium, or dimensions of the resource, use the property Format.
generatedAtTime	0..1	DateTime	(prov) Generation is the completion of production of a new entity by an activity. This entity did not exist before generation and becomes available for usage after this generation. [CIM context: The date and time when the model was serialized in the document where the header is located. The format is an extended format according to the ISO 8601-2005. European exchanges shall refer to UTC.].
atLocation	0..1	IRI	(prov) A location can be an identifiable geographic place (ISO 19112), but it can also be a non-geographic place such as a directory, row, or column. As such, there are numerous ways in which location can be expressed, such as by a coordinate, address, landmark, and so forth. [CIM context: Reference to a region or a domain for which this model is provided.].
wasInfluencedBy	1..n	IRI	(prov) Influence is the capacity of an entity, activity, or agent to have an effect on the character, development, or behavior of another by means of usage, start, end, generation, invalidation, communication, derivation, attribution, association, or delegation. [CIM context: A reference to the model on which the model serialised in this document depends on. The references are maintained by the producer of the model. Minimum requirements for the dependency are specified and can be restricted within a business process as long as they do not contradict requirements by standards. For instance, IEC 61970-600-1 defines minimum requirements for the profiles defined in that standard.].
wasGeneratedBy	1..1	IRI	(prov) Generation is the completion of production of a new entity by an activity. This entity did not exist before generation and becomes available for usage after this generation. [CIM context: Reference to an activity or the exact business nature (process, configuration) which produced or uses the model.].
wasAttributedTo	1..1	IRI	(prov) Attribution is the ascribing of an entity to an agent. [CIM context: Reference to the agent (or service provider) from which the model originates.].
wasRevisionOf	0..1	IRI	(prov) A revision is a derivation for which the resulting entity is a revised version of some original. The implication here is that the resulting

name	mult	type	description
			entity contains substantial content from the original. Revision is a particular case of derivation. [CIM context: When a model is updated the resulting model supersedes the models that were used as basis for the update. Hence this is a reference to the model which are superseded by this model. A model can supersede 1 or more models, e.g. a difference model or a full model supersede multiple models (difference or full). In this case, multiple properties are included in the header. The referenced document(s) is (are) identified by the URN/MRID/UUID in the FullModel rdf:about attribute when full model(s) is (are) referenced and by the URN/MRID/UUID in the DifferenceModel rdf:about attribute when difference model(s) is (are) referenced.].
inXSDDateTimeStamp	1..1	DateTimeStamp	(time) Position of an instant, expressed using xsd:dateTimeStamp, in which the time-zone field is mandatory. [CIM context: The date and time that this model represents, i.e. for which the model is (or was) valid. If used in relation with hasXSDDuration it indicates the beginning of the validity period. It is indicating either an instant (in cases where the model is only valid for a point in time) or the start time of a period. If not provided the model is considered valid for any time stamp. The format is an extended format according to the ISO 8601-2005. European exchanges shall refer to UTC.].
hasXSDDuration	1..1	Duration	(time) Extent of a temporal entity, expressed using xsd:duration. [CIM context: The duration of the validity period of the model that it is serialized in the document where the header is located. It is only used in relation to the inXSDDateTimeStamp property which indicates the beginning of the validity period of the model. The end of the validity period is derived from both inXSDDateTimeStamp and hasXSDDuration.].
processType	1..1	IRI	(eumd) The exact business nature. Reference to Business Process configurations.
creator	1..1	StringIRI	(dct) An entity responsible for making the resource. Recommended practice is to identify the creator with a URI. If this is not possible or feasible, a literal value that identifies the creator may be provided. [CIM context: The name of the agent (Modeling Authority) from which the model originates].
serviceLocation	0..1	IRI	(eumd) Reference to a service location (region or a domain).
versionInfo	0..1	String	(owl) The annotation property that provides version information for an ontology or another OWL construct. DCAT-AP definition:

name	mult	type	description
			This property contains a version number or other version designation of the Dataset. OWL definition: An owl:versionInfo statement generally has as its object a string giving information about this version, for example RCS/CVS keywords. This statement does not contribute to the logical meaning of the ontology other than that given by the RDF(S) model theory. Although this property is typically used to make statements about ontologies, it may be applied to any OWL construct. For example, one could attach a owl:versionInfo statement to an OWL class. [CIM context: The version of the model. If the document is imported and exported with no change the version number is the kept same. The version changes only if the content of the model changes. It is the same logic as for the header identifier. The version is the human readable identifier.].

3.4 (CSA) CoordinatedImpactAssessmentMatrix

Inheritance path = ImpactAssessmentMatrix : IdentifiedObject
Coordinated impact assessment matrix.
Table 3 shows all attributes of CoordinatedImpactAssessmentMatrix.

Table 3 – Attributes of ImpactAssessmentMatrixProfile::CoordinatedImpactAssessmentMatrix

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.5 (CSA) CalculationBasedImpactAssessmentMatrix

Inheritance path = ImpactAssessmentMatrix : IdentifiedObject
Calculation based impact assessment matrix. It relates to the remedial action schedule.
Table 4 shows all attributes of CalculationBasedImpactAssessmentMatrix.

Table 4 – Attributes of ImpactAssessmentMatrixProfile::CalculationBasedImpactAssessmentMatrix

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.6 (abstract,CSA) ImpactAssessmentMatrix

Inheritance path = IdentifiedObject
It is the result of an impact assessment analysis for each remedial action or remedial action schedule onto the grid and operation of each system operator.
Table 5 shows all attributes of ImpactAssessmentMatrix.

Table 5 – Attributes of ImpactAssessmentMatrixProfile::ImpactAssessmentMatrix

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.7 (CSA) ListBasedImpactAssessmentMatrix

Inheritance path = ImpactAssessmentMatrix : IdentifiedObject
List based impact assessment matrix. It refers to the remedial action.
Table 6 shows all attributes of ListBasedImpactAssessmentMatrix.

Table 6 – Attributes of ImpactAssessmentMatrixProfile::ListBasedImpactAssessmentMatrix

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.8 (CSA) OutcomeValue root class

This is the outcome of an impact assessment matrix.
Table 7 shows all attributes of OutcomeValue.

Table 7 – Attributes of ImpactAssessmentMatrixProfile::OutcomeValue

name	mult	type	description
outcome	1..1	OutcomeImpactAssessmentKind	(CSA) Outcome value.

Table 8 shows all association ends of OutcomeValue with other classes.

Table 8 – Association ends of ImpactAssessmentMatrixProfile::OutcomeValue with other classes

mult from	name	mult to	type	description
1..*	ImpactAssessmentMatrix	1..1	ImpactAssessmentMatrix	(CSA) the impact assessment matrix which has this value.
0..*	RemedialAction	0..1	RemedialAction	(CSA) The remedial action that has an outcome value.
0..*	RemedialActionSchedule	0..1	RemedialActionSchedule	(CSA) The remedial action schedule that has an outcome value.
0..*	SystemOperator	1..1	SystemOperator	(CSA) The system operator that has an outcome value.

3.9 (abstract,CSA) RemedialAction

Inheritance path = IdentifiedObject
A remedial action is described by one of many grid state alterations applied to a grid model state or particular scenario in order to resolve one or more Identified constraints. Only costly remedial actions require a cost characteristic.
Table 9 shows all attributes of RemedialAction.

Table 9 – Attributes of ImpactAssessmentMatrixProfile::RemedialAction

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.10 (abstract,CSA) RemedialActionSchedule

Inheritance path = IdentifiedObject
This is a schedule for a determined remedial action.
Table 10 shows all attributes of RemedialActionSchedule.

Table 10 – Attributes of ImpactAssessmentMatrixProfile::RemedialActionSchedule

name	mult	type	description
description	0..1	String	inherited from: IdentifiedObject
mRID	1..1	String	inherited from: IdentifiedObject
name	0..1	String	inherited from: IdentifiedObject

3.11 (abstract,CSA) SystemOperator root class

System operator.

3.12 (abstract) IdentifiedObject root class

This is a root class to provide common identification for all classes needing identification and naming attributes.
Table 11 shows all attributes of IdentifiedObject.

Table 11 – Attributes of ImpactAssessmentMatrixProfile::IdentifiedObject

name	mult	type	description
description	0..1	String	The description is a free human readable text describing or naming the object. It may be non unique and may not correlate to a naming hierarchy.
mRID	1..1	String	Master resource identifier issued by a model authority. The mRID is unique within an exchange context. Global uniqueness is easily achieved by using a UUID, as specified in RFC 4122, for the mRID. The use of UUID is strongly recommended. For CIMXML data files in RDF syntax conforming to IEC 61970-552, the mRID is mapped to rdf:ID or rdf:about attributes that identify CIM object elements.
name	0..1	String	The name is any free human readable and possibly non unique text naming the object.

3.13 (CSA) OutcomeImpactAssessmentKind enumeration

Outcome impact assessments kinds.
Table 12 shows all literals of OutcomeImpactAssessmentKind.

Table 12 – Literals of ImpactAssessmentMatrixProfile::OutcomeImpactAssessmentKind

literal	value	description
true		True.
false		False.
undecided		Undecided. Used only for list-based impact assessment matrix.

3.14 (profcim) IRI primitive

An IRI (Internationalized Resource Identifier) within an RDF graph is a Unicode string that conforms to the syntax defined in RFC 3987.
The primitive is serialized as rdf:resource in RDFXML.
IRIs in the RDF abstract syntax must be absolute, and may contain a fragment identifier.
IRI equality: Two IRIs are equal if and only if they are equivalent under Simple String Comparison according to section 5.1 of [RFC3987]. Further normalization must not be performed when comparing IRIs for equality.
IRIs are a generalization of URIs [RFC3986] that permits a wider range of Unicode characters. Every absolute URI and URL is an IRI, but not every IRI is an URI. When IRIs are used in operations that are only defined for URIs, they must first be converted according to the mapping defined in section 3.1 of [RFC3987]. A notable example is retrieval over the HTTP protocol. The mapping involves UTF-8 encoding of non-ASCII characters, %-encoding of octets not allowed in URIs, and Punycode-encoding of domain names.

3.15 Date primitive

Date as "yyyy-mm-dd", which conforms with ISO 8601. UTC time zone is specified as "yyyy-mm-ddZ". A local timezone relative UTC is specified as "yyyy-mm-dd(+/-)hh:mm".

3.16 DateTime primitive

Date and time as "yyyy-mm-ddThh:mm:ss.sss", which conforms with ISO 8601. UTC time zone is specified as "yyyy-mm-ddThh:mm:ss.sssZ". A local timezone relative UTC is specified as "yyyy-mm-ddThh:mm:ss.sss-hh:mm". The second component (shown here as "ss.sss") could have any number of digits in its fractional part to allow any kind of precision beyond seconds.

3.17 Duration primitive

Duration as "PnYnMnDTnHnMnS" which conforms to ISO 8601, where nY expresses a number of years, nM a number of months, nD a number of days. The letter T separates the date expression from the time expression and, after it, nH identifies a number of hours, nM a number of minutes and nS a number of seconds. The number of seconds could be expressed as a decimal number, but all other numbers are integers.

3.18 (eumd) DateTimeStamp primitive

Position of an instant, expressed using xsd:dateTimeStamp, in which the time-zone field is mandatory.

3.19 String primitive

A string consisting of a sequence of characters. The character encoding is UTF-8. The string length is unspecified and unlimited.

3.20 (profcim) StringIRI primitive

An IRI (Internationalized Resource Identifier) within an RDF graph is a Unicode string that conforms to the syntax defined in RFC 3987.
The primitive is serialized as literal without language support.
IRIs in the RDF abstract syntax must be absolute, and may contain a fragment identifier.
IRI equality: Two IRIs are equal if and only if they are equivalent under Simple String Comparison according to section 5.1 of [RFC3987]. Further normalization must not be performed when comparing IRIs for equality.

IRIs are a generalization of URIs [RFC3986] that permits a wider range of Unicode characters. Every absolute URI and URL is an IRI, but not every IRI is an URI. When IRIs are used in operations that are only defined for URIs, they must first be converted according to the mapping defined in section 3.1 of [RFC3987]. A notable example is retrieval over the HTTP protocol. The mapping involves UTF-8 encoding of non-ASCII characters, %-encoding of octets not allowed in URIs, and Punycode-encoding of domain names.

3.21 (profcim) StringFixedLanguage primitive

A string consisting of a sequence of characters. The character encoding is UTF-8. The string length is unspecified and unlimited.
The primitive is serialized as literal without language support.

3.22 (profcim) URL primitive

A Uniform Resource Locator (URL), colloquially termed a web address, is a reference to a web resource that specifies its location on a computer network and a mechanism for retrieving it. A URL is a specific type of Uniform Resource Identifier (URI), although many people use the two terms interchangeably.URLs occur most commonly to reference web pages (http), but are also used for file transfer (ftp), email (mailto), database access (JDBC), and many other applications.

Annex A (informative): Sample data

A.1 General

This Annex is designed to illustrate the profile by using fragments of sample data. It is not meant to be a complete set of examples covering all possibilities of using the profile. Defining a complete set of test data is considered a separate activity to be performed for the purpose of setting up interoperability testing and conformity related to this profile.

A.2 Header
