

Expert Group Criteria for significant modernisation

Status and way forward

The report has been developed significantly

The Expert Group developed the report document adding

- Definitions
- Agreement on maintenance

Definitions are based on EN 13306 and EU documents.

Two general approaches have been identified

1. Threshold

In case an existing facility is modified by e.g. more than 10 %, it is deemed to be significantly modified

Challenge: Which parameter should be used to measure?

EG agreed on technical parameters to be relevant from a system's perspective and thus decisive

2. Incremental application

Each time a facility is modified, the system operator analyses the modification and assesses its effects on the facility's technical performance. If higher performance is possible, higher requirements might be applied.

Way forward

- Further elaborate the report adding
 - Discussion of two approaches
 - Rationales and proportionality
- Next meeting of EG will take place on March 26th
