

IGCC Regular Report on Social Welfare

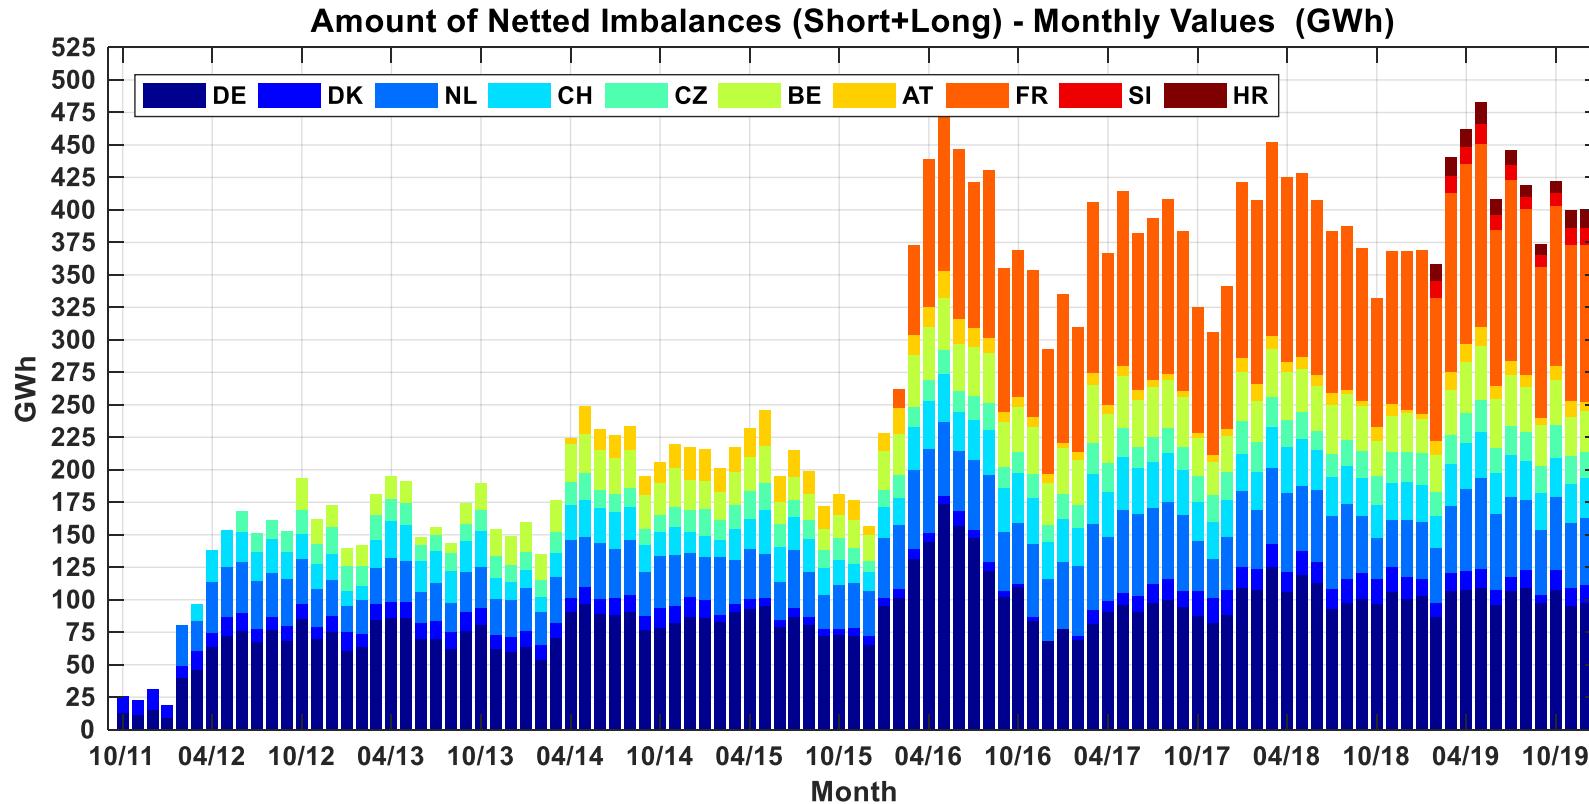

Q4 2019

IGCC-Settlement – Basic Principle

(Methodology applied from 01/02/2016)

Opportunity Prices for Imbalance Netting	<p>without IGCC</p> $\text{SCE}_{\text{before IGCC}} \text{ [MWh]} \times \text{SCE price}_{\text{before IGCC}} \text{ [€/MWh]}$	<p>with IGCC</p> <p>IGCC exchange</p> $\text{SCE}_{\text{after IGCC}} \text{ [MWh]} \times \text{SCE price}_{\text{after IGCC}} \text{ [€/MWh]}$	<p>Opportunity Price = Opportunity Value/IGCC Volume</p> $\frac{[(\text{SCE}_{\text{before IGCC}} * \text{SCE price}_{\text{before IGCC}}) - (\text{SCE}_{\text{after IGCC}} * \text{SCE price}_{\text{after IGCC}})]}{\text{IGCC exchange}}$
IGCC Initial Settlement Price	<ul style="list-style-type: none"> – IGCC Initial Settlement Price (P_{IGCC}): Energy weighted ($E_{\text{Imp},i}$ and $E_{\text{Exp},i}$) average of the opportunity prices ($C_{\text{Imp},i}$ and $C_{\text{Exp},i}$) – Symmetric_n price for IGCC imports and exports $P_{\text{IGCC}} = \sum_{i=1}^n (C_{\text{Imp},i} E_{\text{Imp},i} + C_{\text{Exp},i} E_{\text{Exp},i}) / \sum_{i=1}^n (E_{\text{Imp},i} + E_{\text{Exp},i})$		
IGCC Settlement Ex-post Adjustment	<ul style="list-style-type: none"> – In case of negative individual benefits for one or more IGCC Members but positive overall benefit of the IGCC, an ex-post adjustment of settlement is performed in order to guarantee TSO neutrality. – IGCC adjusted settlement prices (P'_{IGCC}) which may vary from member to member depending on their benefit before the adjustment 		
Calculation of Cost Reduction	<ul style="list-style-type: none"> – Cost reduction for a participant is driven by the spread between the opportunity price and the IGCC adjusted settlement price $B'_i = \sum_{t=1}^T (C_{\text{Imp},i,t} - P'_{\text{IGCC},i,t}) \cdot E_{\text{Imp},i,t} + \sum_{t=1}^T (P'_{\text{IGCC},i,t} - C_{\text{Exp},i,t}) \cdot E_{\text{Exp},i,t}$		

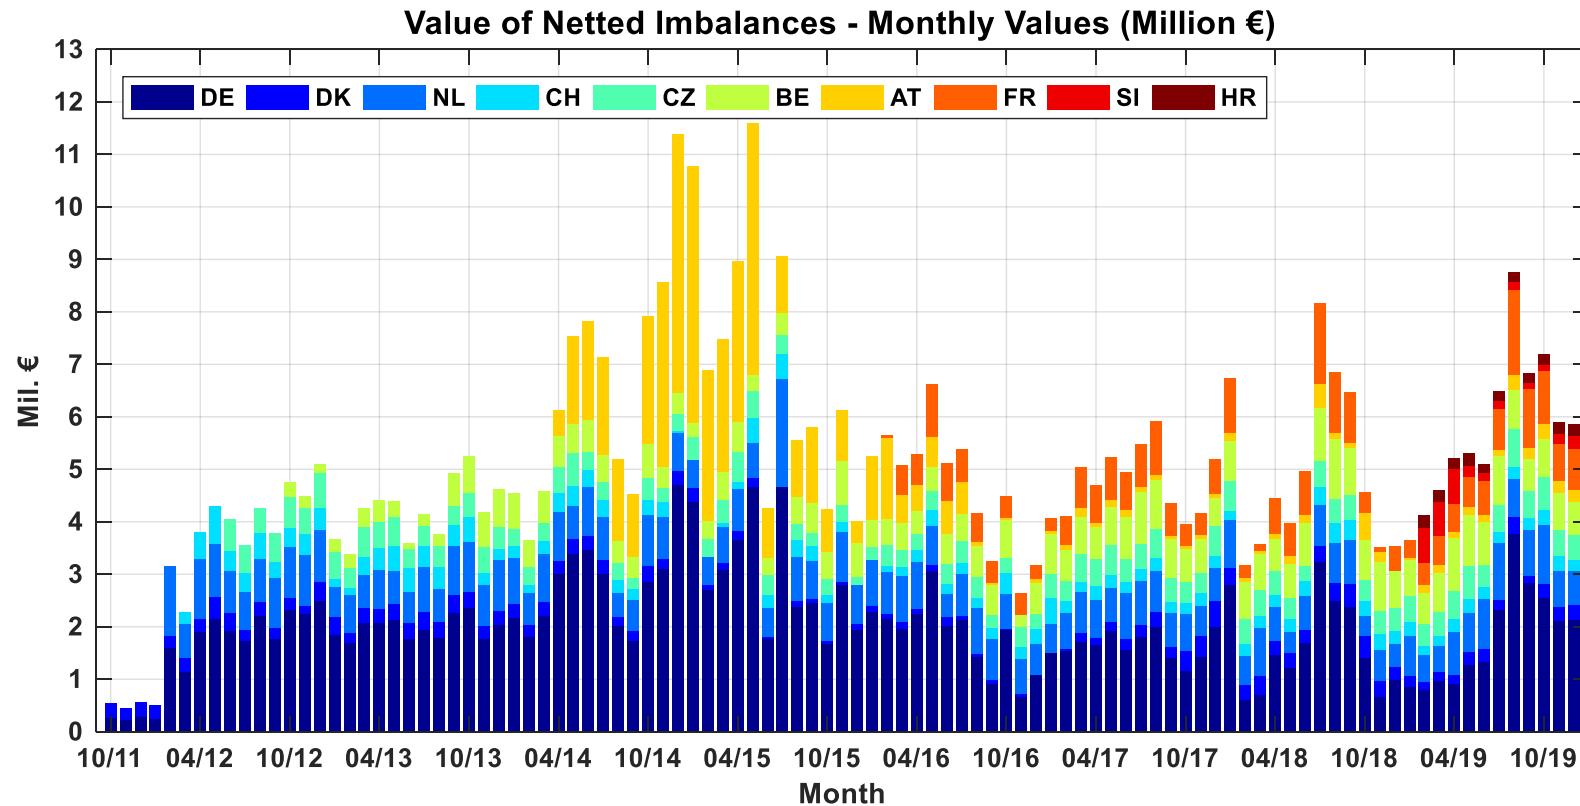

Monthly Volumes of Netted Imbalances

Monthly Volumes of Netted Imbalances (last Year, in GWh)

Value of Netted Imbalances - Development

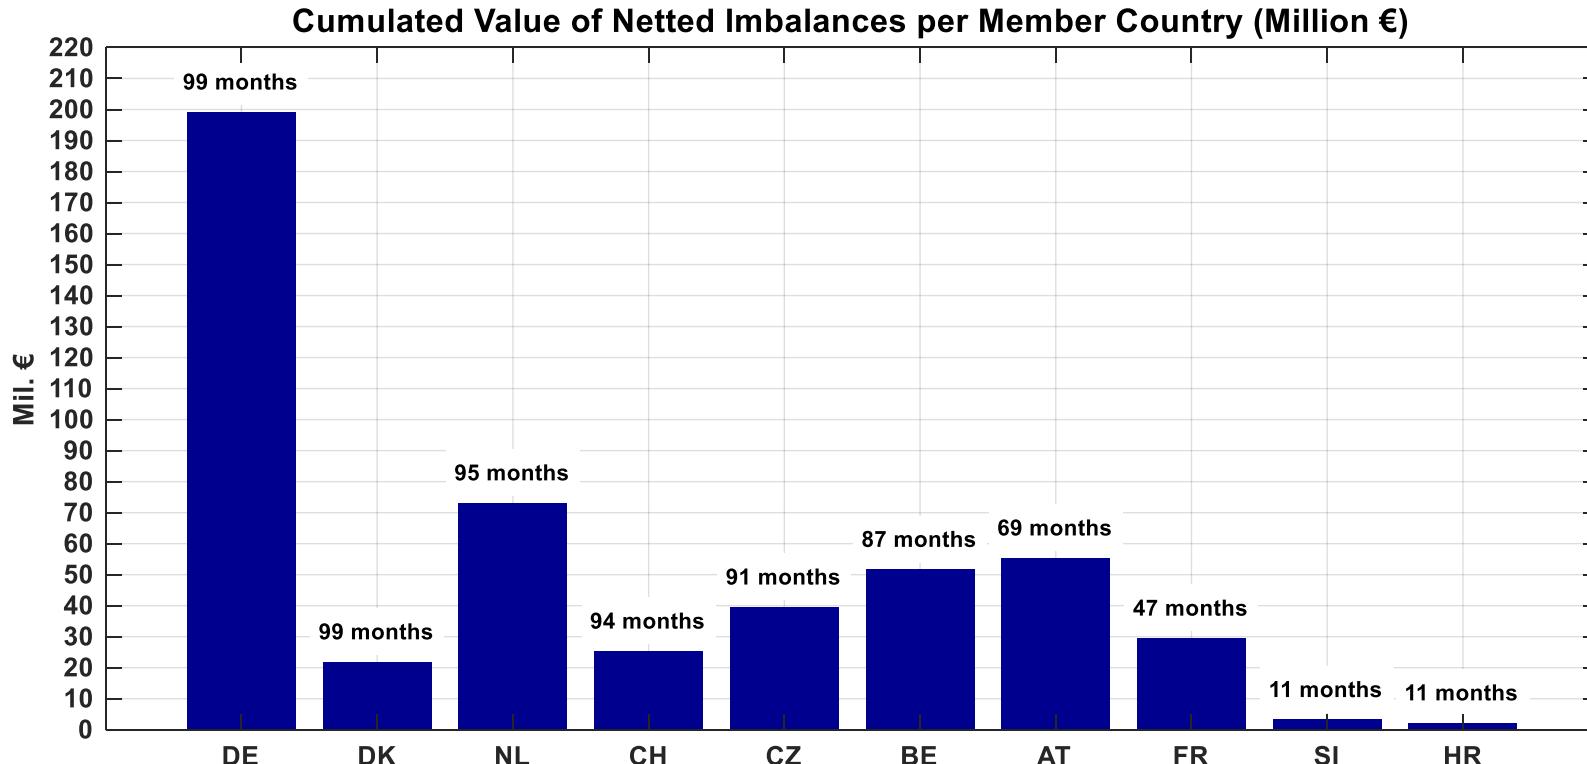

Monthly Percentage of Avoided pos. aFRR-Activations (last 6 Months)

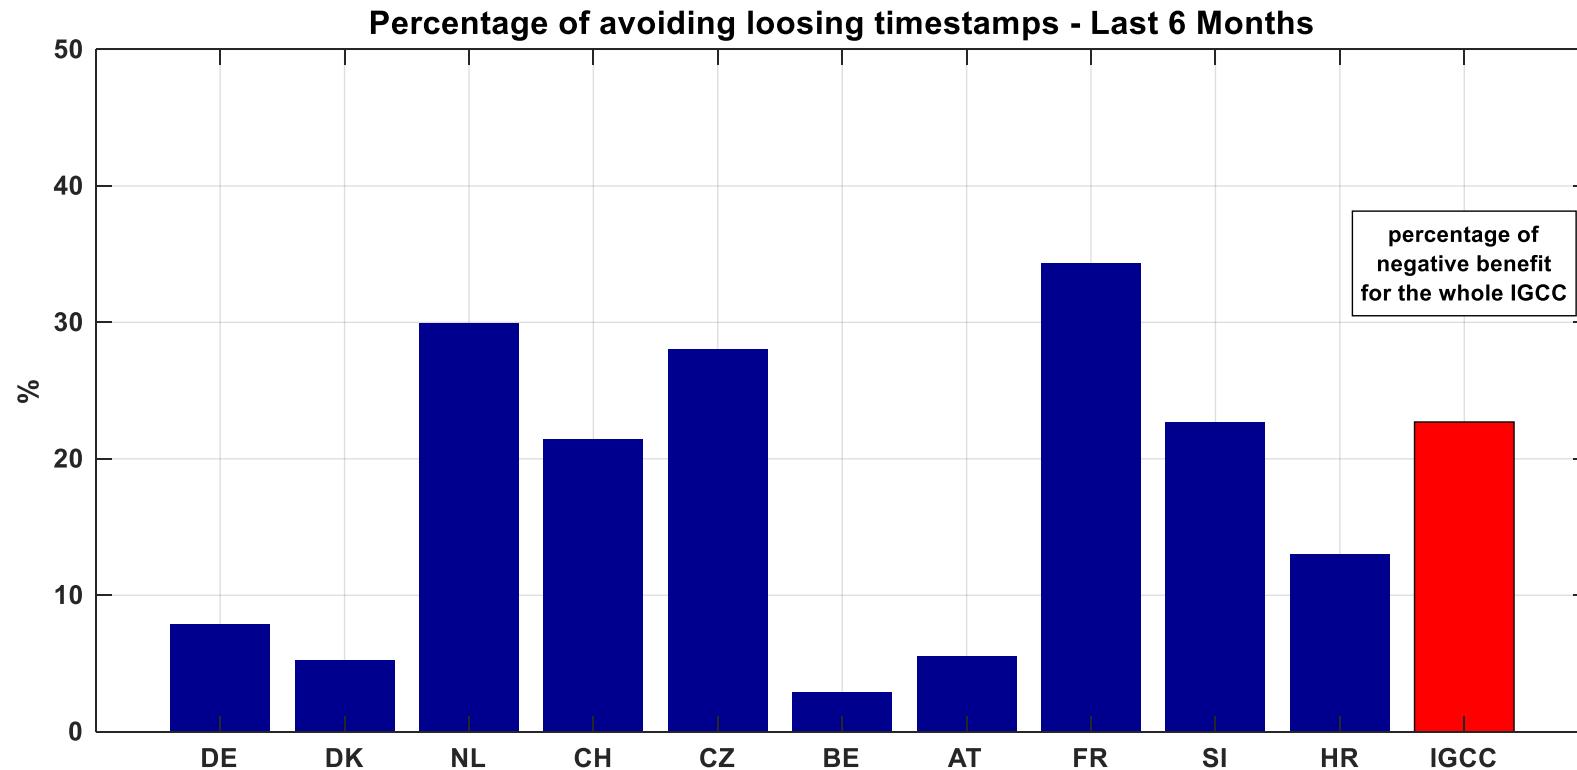

Monthly Percentage of Avoided neg. aFRR-Activations (last 6 Months)

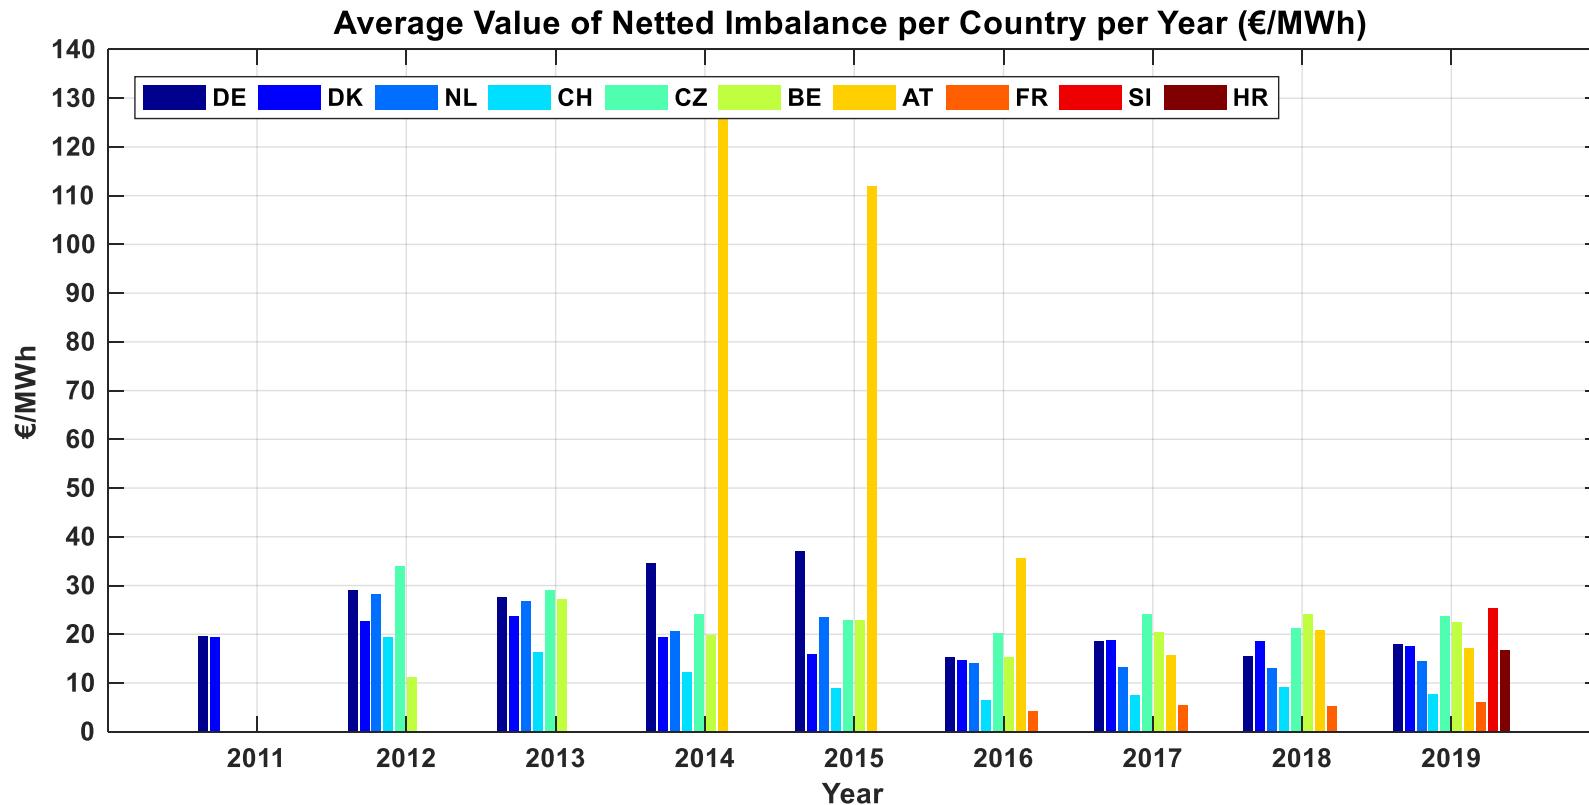

Cumulated Value of Avoided Activations

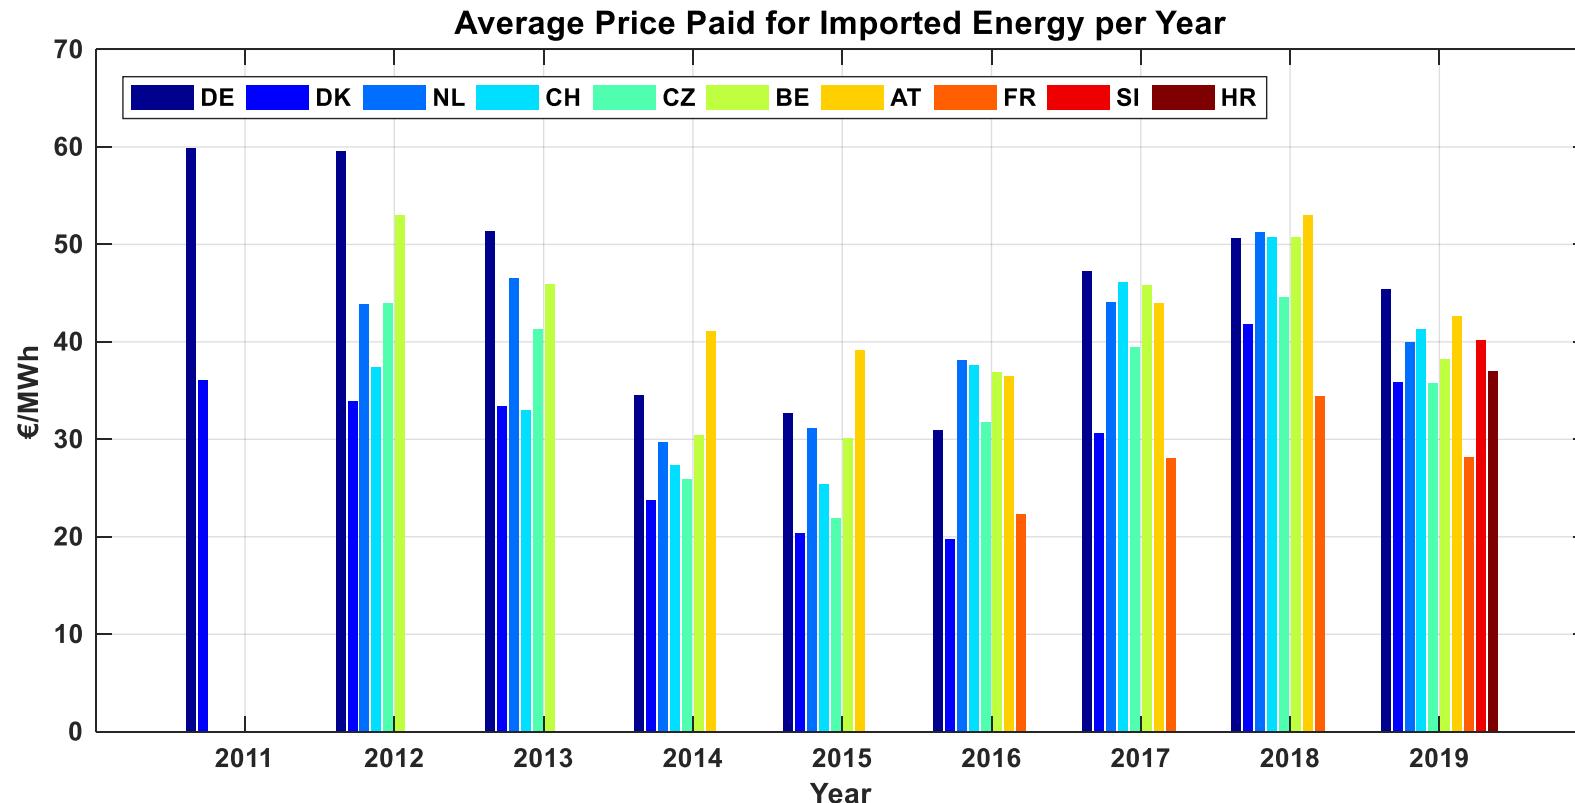

Percentage of avoiding loosing timestamps due to the second step of settlement method

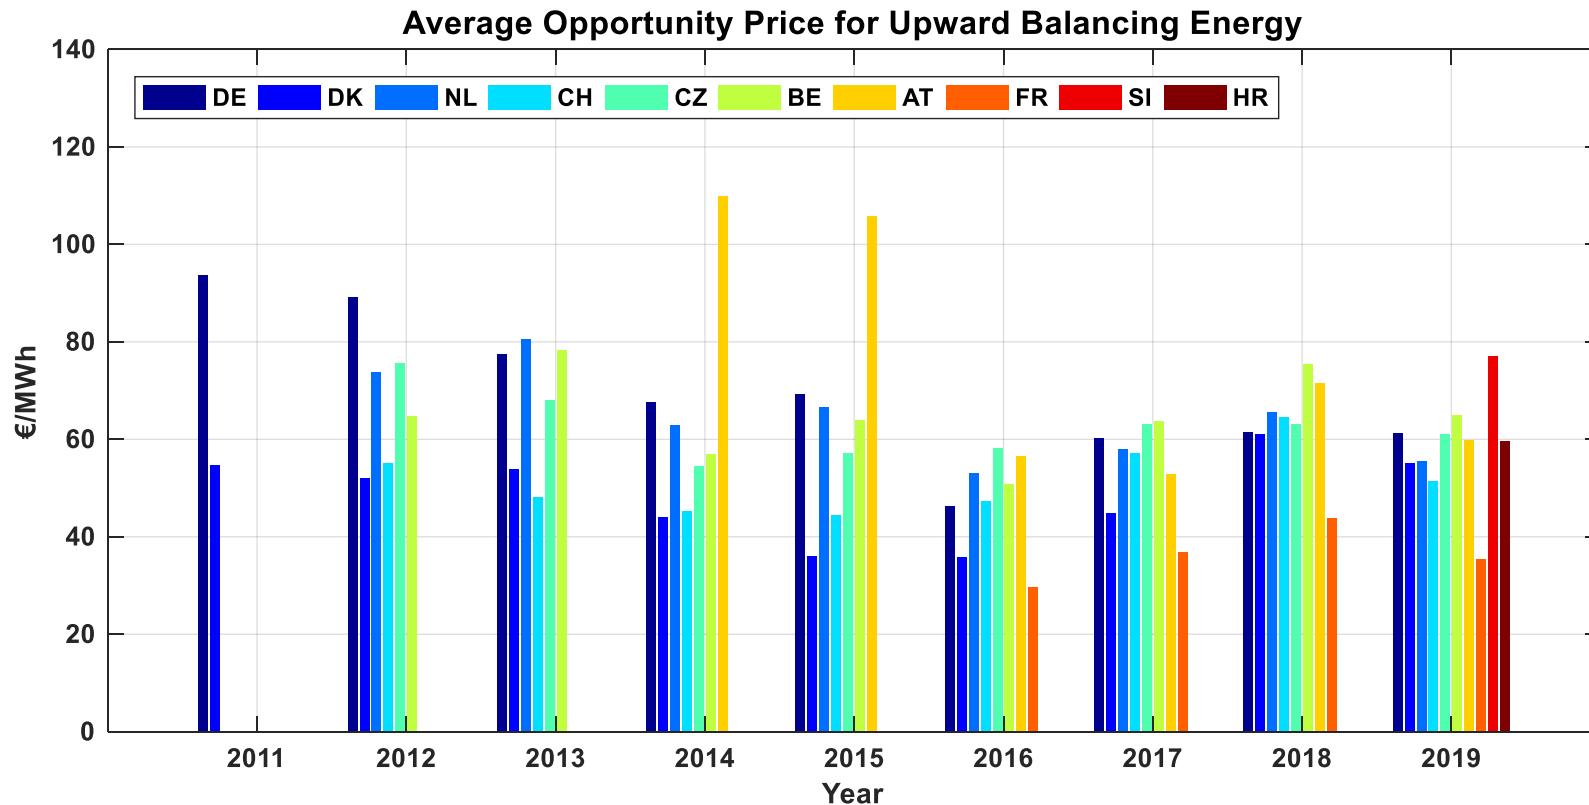

Average Value of Netted Imbalance per Country per Year in €/MWh

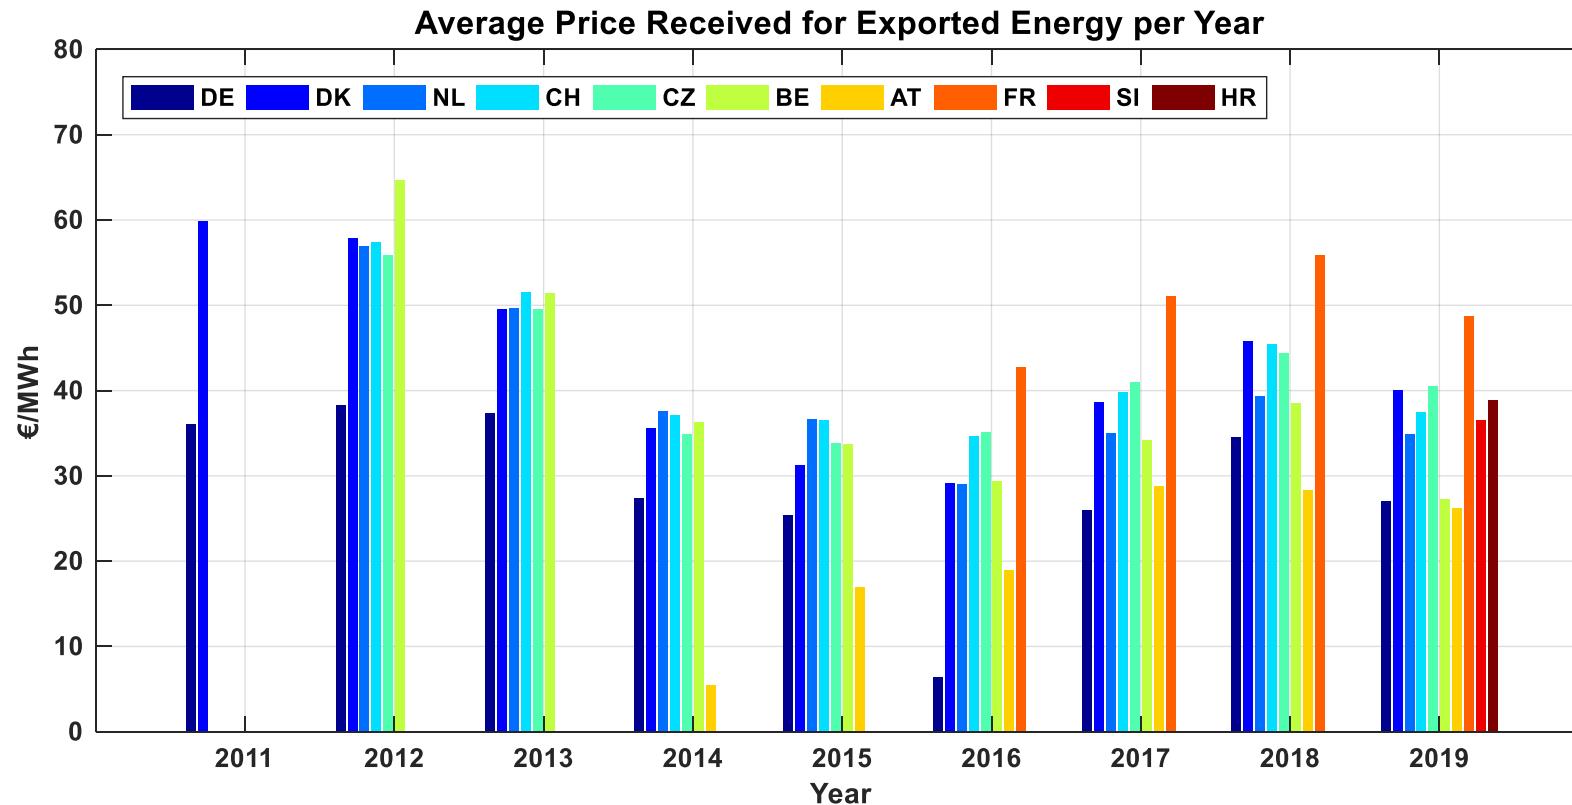

Average Price Paid for Imported Energy per Year

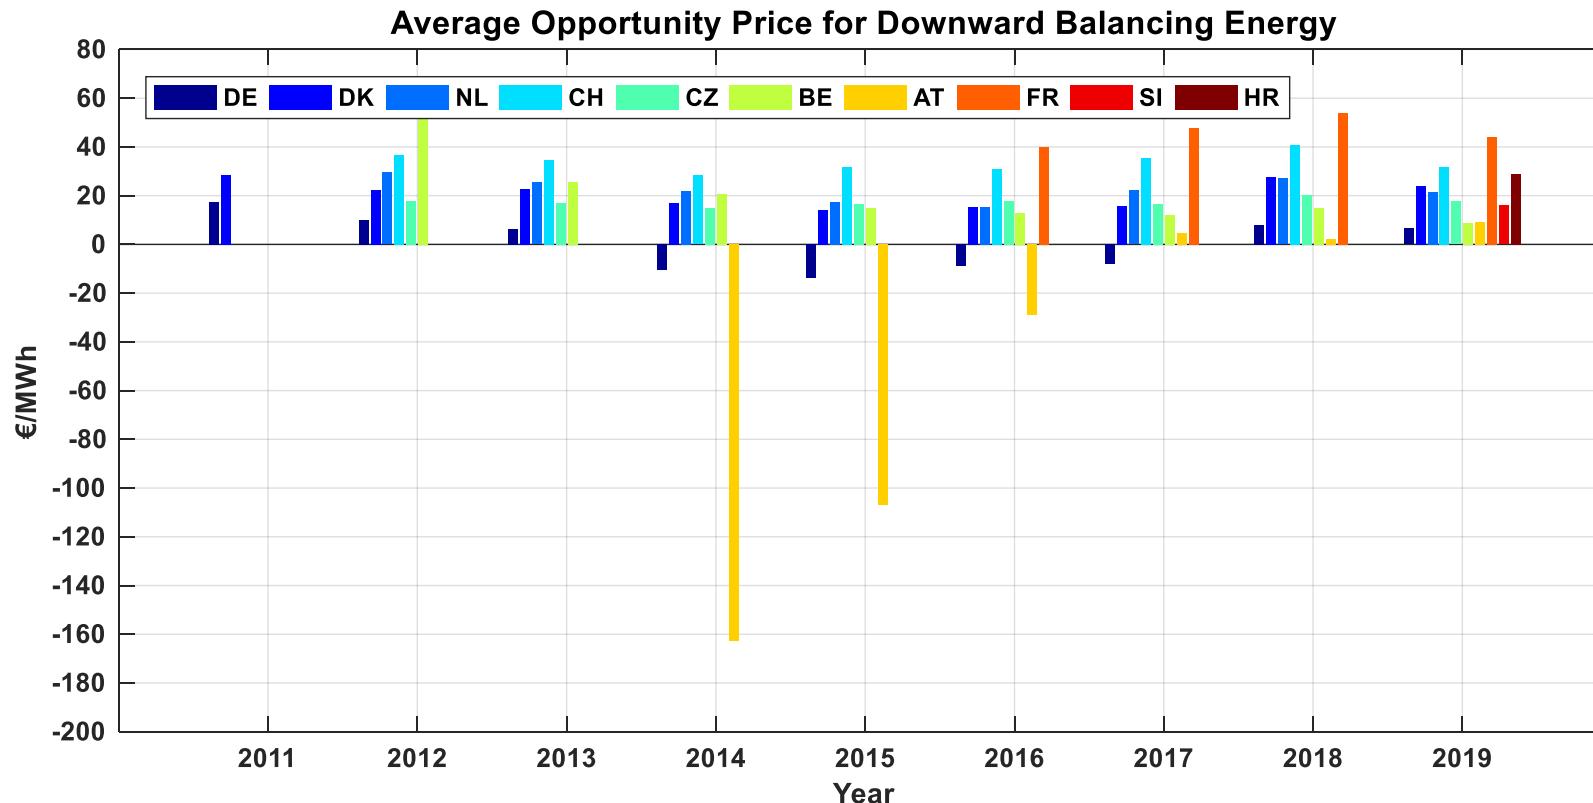

Average Opportunity Price for Upward Balancing Energy

Average Price Received for Exported Energy per Year

Average Opportunity Price for Downward Balancing Energy

Appendix - Mathematical formulas of figures

- Amount of netted imbalances (volume):

$$E_{short+long,i} = E_{exp,i} + E_{Imp,i}$$

- Amount of netted imbalances (value):

$$R_{IGCC} = \sum_{i=1}^n (C_{Imp,i} - C'_{IGCC}) \cdot E_{Imp,i} + \sum_{i=1}^n (C'_{IGCC} - C_{Exp,i}) \cdot E_{Exp,i}$$

Appendix - Mathematical formulas of figures

- Local value of the avoided activated positive balancing energy (imported by IGCC):

$$LV_{paid,i} = \sum_{i=1}^n C_{\text{Imp},i} \cdot E_{\text{Imp},i}$$

- Local value (received) of the avoided activated negative balancing energy (exported to IGCC):

$$LV_{received,i} = \sum_{i=1}^n C_{\text{Exp},i} \cdot E_{\text{Exp},i}$$

Appendix - Mathematical formulas of figures

- Average price payed for imported energy:

$$C_{paid,i} = \frac{\sum_{i=1}^n C_{IGCC,i} \cdot E_{Imp,i}}{\sum_{i=1}^n E_{Imp,i}}$$

- Average price received for exported energy:

$$C_{received,i} = \frac{\sum_{i=1}^n C_{IGCC,i} \cdot E_{Exp,i}}{\sum_{i=1}^n E_{Exp,i}}$$

Appendix - Mathematical formulas of figures

- Average opportunity prices upward:

$$OP_{upward,i} = \frac{\sum_{i=1}^n C_{\text{Imp},i} \cdot E_{\text{Imp},i}}{\sum_{i=1}^n E_{\text{Imp},i}}$$

- Average opportunity prices downward:

$$OP_{downward,i} = \frac{\sum_{i=1}^n C_{\text{Exp},i} \cdot E_{\text{Exp},i}}{\sum_{i=1}^n E_{\text{Exp},i}}$$
