

Optimisation of capacity allocation

- **EURELECTRIC considers that the target model in the CACM GL proves to be very efficient, when :**
 - associated with UIOSI rules needed to avoid hoarding
 - optimising all the available x-border capacity through the market
- **Co-optimisation in the Balancing GL is in conflict with the CACM target model**
 - Any TSO reservation is an intervention in the market
 - TSOs should facilitate co-optimisation through countertrade schemes

Re-optimisation should first be further developed

- Close cooperation between TSOs, recalculations should increase the available capacity from DA to ID, without additional risks for the system
- The same should apply between intra-day and balancing
- View on available capacity should be updated frequently
- Main effort should be to get a speedy calculation and coordination process.
