(1) JIEL block - Serbia&Montenegro and FYR of Macedonia

(2) NTC values between JIEL block and BiH are not calculated because of the existence of three independent islands in EPS of BiH (radially connected to the II UCTE zone)

(3) These values pertain to the political borders and not to the limits of the control areas.

(4) Greek values are cumulative-it is the share of the total Greek NTC for the imports from north (600=400+200)

Bulgarian (700) and EKC (400) values of NTCs towards Greece are calculated independently, and are not cumulative

(5) Regulated capacities: NTC values obtained by the Greek Regulatory Body for the exports from Greece

(6) Virtual calculation of NTC, Turkey observed as connected to the 2nd UCTE zone

XX: Interface between two UCTE synchronous zones.
